One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s]

missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

I haven't had a ny problems getting it to work with my wife's ancient
Panasonic cassette recorder. Maybe you're experiencing cabling or
connection problems.

Have a friend who wants to sell a PRO-2004. Appears to be in very good condition. He has the original box, manual, the original detachable antenna as well as an additional mobile antenna (although he claims only to use it in the house).

The unit is clean, the touch pad is intact (no split plastic), display is clear and bright.

He says make an offer. What is it worth (and what should I offer)?

Many thanks for responding.

L.

What are the precautions with the Uniden batteries? I can't leave the power pack continually plugged into the scanner without frying the batteries that are in it? If the batteries fry then Uniden has got some pretty lame charger circuitry if you ask me.

Okay...what 3 bands do you want to listen to? What freqs are we
talking about here. I can make some recommendations, but I need to
know what you are going to attempt to listen to....VHF-lo, VHF-hi,
UHF, UHF t-band, 800, 900, etc...

ESBAM!!!

>each unit can pick up? Is a scanner meant more for local things, like
>municipality-based listening, while shortwave is meant more for international
>listening?

Yes, generally a scanner is more for local monitoring, while a
shortwave receiver is used for international or intercontinental
listening.

Typically, the shortwave frequencies are considered to be 3-30 MHz
while "scanner" frequencies are considered to be VHF (30-300 MHz) and
UHF (300-999 MHz). Note that these ranges are not written in stone, but
are based upon general convention.

SHORTWAVE
Shortwave frequencies typically "propagate" (travel) world-wide,
although in truth frequencies around 3 MHz do so much less than those
around 14-15 MHz. At a sunspot low (as we are in now), frequencies in the
20-30 MHz are often ineffective for world-wide communications, while in
a sunspot maximum (where we'll be in about 5 years) 20-30 MHz are very
often useful for world wide communications.

Therefore, the communications you hear on the shortwave frequencies
are typically intended for wide area (intercontinental or worldwide)
distribution. Examples are international broadcasters, like the BBC,
Voice of America, Voice of Russia (formerly Radio Moscow), Radio Havana,
HCJB, etc. They are usually AM.
In addition, there are wide area military and aeronautical comms on
the shortwave frequencies. These activities are often called
"utilities." They are usually SSB (single sideband).

VHF/UHF SCANNING
Police, law enforcement, fire, emergency services, etc. tend to use
FM on the "scanner" frequencies. Most of the services are clustered in
ranges around 155 MHz, 460 MHz and 855 MHz and operate on FM.
Military and aircraft communications operate mainly on AM around
123 MHz and 290 MHz.
There is a large chunk of frequencies from approx 500-800 MHz that
are used for the UHF TV channels, audio and video.
Typically at these frequencies, reliable communications are limited to

50-100 miles, somewhat similar to what you experience with FM broadcast radio (88-108 MHz) and the television frequencies (though voice communications tend to be effective further away than video communications.)

HOWEVER, many scanners cover a range down to 25 MHz, which is into the "shortwave" range. The CB frequencies around 27 MHz may be one reason for this.

That's the 25 cent explanation. Insert another quarter if you want for more. :-)

problem. Thanks to the
>ECPA, decoding and monitoring these data transmissions would be a federal offense, so I
really doubt that you
>will see any company coming out with any kind of a device to do this anytime soon.

For a "creative" company, this wouldn't be such a problem. They could
sell a "kit"... an *almost* completed circuit board (sold for
"experimental and parts purposes only") which, with the addition of a
few easily obtained additional parts, becomes a decoder. But without
these parts, they would be selling a non-working circuit board, which would
not be illegal. It would be "interesting" that hobbyists would be a
relatively high price for a "junk" circuit board, but the sales wouldn't
be illegal.
These circuit boards would have to sell for enough money
to pay for the software also, because the software (with the final
assembly instructions for the circuit board) would be anonymously
(and untracably) made available on BBSes and FTP sites for "free"...
but, of course, the software would make the aforementioned circuitry
useable. Even if the feds kept making Sysops remove the software (and
do they REALLY have the manpower to make this a major effort?), it
would get sufficient distribution to "get to" the people that wanted
it (via "sneaker net", the exchange of diskettes, etc.)
The person using this combination of hardware and software would
be doing something illegal (as they are if they listen to cell phones,
or drive over 65 mph or toss their gum out of the car window), but it
would be hard to trace... And hit "reset" on the computer when someone
knocks at the door, and the software (the key to making the device
illegal) would disappear.

It's doable, within (perhaps barely) the law for the manufacturer.

The same path could be used for the sale of digital descramblers. (Finding
the correct "key-code" would be a *bit* more problematic, however.)

PK>PKH

I have seen NiMH drop in packs at a local ham flea market that fit
many ham HTs. Unless you trickle charge these packs, you won't get the
extra capacity. The charger you have now expects a certain capacity in
the pack and charges accordingly. You would need to charge longer at the
same current to get full capacity.

Remember that while NiMH capacity is 50% greater than NiCad, its self
discharge is poor.

You could use an intercom or baby monitor repeater to
rebroadcast the traffic around the house, as I do.

Too, you could connect a tape recorder to your scanner.
Radio Shack puts a VOX recorder on sale for about $30 twice
a year. Consider using an endless loop tape, the type
made for answering machines, if you want the capability
of trapping the last few minutes of traffic instead of long
term recording.

If your scanner lacks a carrier activated relay and
your favorite tape recorder isn't sound activated,
check out the NiteLogger II, made by Benjamin Michael Industries.

It plugs into your scanner's external speaker jack
and a taper recorder. (The recorder must have a REMOTE
control jack.) The relay in the NiteLogger II activates
the recorder when your scanner hears something.

It works well and costs about $70 - $80.

I had and solved the same problem, but with a different model scanner.

There are two things I would try if your VOX is being
tripped spuriously:

1) break any DC ground loop by putting a capacitor in series
with the braid, and another in series with the center
conductor of the audio patch cord.

2) introduce attenuation in the audio patch cord

Yes...ditto. Scannermaster is a great resource for pick up the freqs you want. The scan mode is great for a little investigation and will let you pick up some freqs you didn't know existed..but you won't always know who's talking when you pick up the freq without a resource to check. By the way...it's worth the wait !!!

What is the difference between the DS (direct sequence) type of SS and the
CDMA? I am aware that there are different types of SS modulation, but I thought
that CDMA was a kind of DS SS.

The Uniden BCT-7 is a great radio for it's intended purpose.

Bill Crocker

p.s. It is perfectly legal for you to modify any and all of your scanners to receive cellular communications. And it is perfectly legal for you to own scanners that are capable of receiving cellular communications. You can buy and sell all the cellular capable scanners you want.

It is illegal to import or manufacture them. It is illegal to listen to cellular communications.

Some of the high end 46/49MHz phones (such as Sony) encode the DTMF using
some sort of digital type transmission. This is a little safer, since all
you hear is a modem-like sound on the base and handset freqs. But I'd
still stay off of cordless unless you don't mind eavesdroppers! Credit
card or bank transactions especially!

Ahaaa, yes, Grasshopper...

If you really want to get serious about monitoring, get a half-dead VCR (no/poor picture). Connect the earphone jack of your Scanner to the Audio Input of the VCR. In the SLP mode, you should have hours and hours of replay!

For REALLY LONG extended recordings, consider installing a transistor COR (Carrier Operated Relay) in your scanner. Use the relay of the COR to 'slave' the REMOTE function of the VCR .

Now your VCR will only record when the channels are active! No dead time between transmissions! COR's usually have a delay ("hang-time") so your 'chops' in conversation (where the first reply words are lost), should be to a minimum. To extend hang-time, change the electrolytics to a larger value. A number of companies offer COR's kits for about $10.

Not! The only thing which is illegal is to USE the receiver to listen to things you aren't supposed to listen to. And for a retailer to sell one which has been defined by the FCC as easily modifiable.

If what you said was true, the feds would have shut down Cellular Security Group years ago. They openly advertise the fact they mod scanners, and they claim to have thousands of satisfied customers.

The trouble I see with this arrangement is that the VCR cannot start and stop quickly, it normally takes it several seconds to start. By this time, you could well lose most of your transmission. And this would be VERY annoying. And VCR's cannot be left in Pause mode indefinitely, most have a limit of about 1-2 minutes. If the VCR were left in Pause mode longer, its heads would be damaged.

What you should use is an ordinary cassette recorder, they can start and stop much more quickly and are easier to control. Also, there are ones which run slower for several hours record time, look in the magazines for ads.

What you don't have a complete grasp on is that the public service agencies want the media to cover their people doing what they do best and most agencies have no objections to the media monitoring. All agencies exist on taxpayers' money and the best way for taxpayers to see what their agency is doing for them is to get media coverage.

They also want buffs (especially fire buffs) to be able to cover their incidents because the buffs supply them with photos that help both in the mediam newsletters and especially in training situations.

There was also a recent case in Tulsa Oklahoma where a person was convicted of both using bootleg Motorola programming software and monitoring the Tulsa Oklahoma PD frequencies. The person sold trunkking radios to the new media. The appelate court overturned the ruling, siting that the airwaves belonged to the public and if it could be monitored, the public had the right to do so. He was still held accountable for the copyright violation.

I am not sure what time you spend with either the media or the public service agencies, but I do that for a living and while some agencies are being sold a bill-of-goods from particular sellers of equipment, most have no objection to the media or buffs monitoring or knowing what they are doing!

I just saw the new BCT-7 with warning light that flashes when CHP use the radio (I guess it monitors the repeater freqs from the trunks of the car and aircraft as well...so it claims.

I can get it for $199.00. Anyone try out this 100 channel scanner? New audio stuff supposedly..don't know how true that claim is either?

A review would be nice.

100CPS scan rate..so it says
Looks real nice but does it work well?

Also..it gets 800mhz..is their a cellular mod that can be done on this radio. I would never do it because it is illegal but it would be nice to know what they covered when building the radio.

Thanks!

3717. Computer Interferrence

Newsgroup: rec.radio.scanner

Actually, I did the hole-in-the-side mod and had no problems.

The Opto tunes the AOR quite nicely!

Just be very careful doing the soldering to the surface-mount
chip resistor. If you feel at all queasy about it, get someone
to help you!!

And follow Opto's suggestion of using an X-Acto knife for the job.

Also, Opto's listed Radio Shack part numbers for the jack and
the connectors do not exist. Just make sure you get 2.5mm jacks all
around and you'll be happy.

Folks, I stand corrected again(!), the agency name is CSIS. Below is part of a message that may be of interest to you?

Canadian Security Intelligence Service, MISSION

The Canadian Security Intelligence Service (CSIS) operates pursuant to the Canadian Security Intelligence Service Act.

CSIS collects, analyzes and retains information and intelligence respecting activities that may on reasonable grounds be suspected of constituting threats to the security of Canada, and reports to and advises the Government of Canada in relation to these matters.

The Service also plays a role in providing security assessments to departments of the Government of Canada (in accordance with section 13 of the CSIS Act and government security policy) and may provide security assessments to the government of a province or any department thereof, any police force in a province, and to the government of a foreign state or institution thereof or an international organization of states or institutions thereof when a security clearance is a required condition of employment.

CSIS may advise any Minister of the Crown on matters relating to the security of Canada, or provide any Minister of the Crown with information relating to security matters or criminal activities that is relevant to the exercise of any power or the performance of any duty or function by that Ministe under the Citizenship Act or the Immigration Act, 1976.

It may also conduct such investigations as are necessary in order to provide security assessments or advice to Ministers. Further, CSIS may, in relation to the defence of Canada or the conduct of international affairs, assist the Minister of National Defence or the Minister of Foreign Affairs and International Trade, within Canada, in the collection of information or intelligence relating to the capabilities, intentions or activities of any foreign state or group of foreign states or any person other than a Canadian citizen or permanent resident, or corporation.

>advice would sure be appreciated. I have an RV and would like to
>install one.
>Thanks Norm.

Scanners that pick up service broadcasts are not illegal. But it may be illegal in your state to install one in a motor vehicle, or licensing may be required.

Most Radio Shack and Uniden Bearcat scanners will meet your needs if you're just interested in police/fire/emergency freqs. Even the low end ones for $100 or so will do. You may want to find out if you have 800MHz freqs in your area though. If so, you may need to go up to about $200 for a scanner that covers the 800MHz band.

Most Radio Shacks have a list of local police/emergency freqs they'll give you if you ask. If not, they carry "Police Call", a publication that lists the freqs in your state, county, and city. Take a look at that to see what freqs you'll need locally. It also contains many other freq ranges, such as weather, air, marine, railroad, etc. As you look through this book, you may find some freqs you didn't know about, and you may take an interest in those too! Just make sure that the scanner you buy covers the freqs your interested in!

Oh, and I wouldn't go asking the salesman at Shack too many questions! It's a great place to buy stuff locally, but the only reliable source of good information in that store is in the publications they sell! They are salesman, not scanner or electronics experts!

I don't remember the exact frequency but it was down in the short-wave band-
around 20-Mhz (or MC as it was in them days). Everybody who had a shortwave
radio was trying to hear it. I remember hearing its faint "beeping" on my
old Hallicrafers S20R.

You have to connect it right after the discrimnator- before the
de-emphasises network (which will remove subcarriers). If your radio is
stereo- the feed going to the stereo decoder should be a good place.
Make sure it before any 67-Khz traps though.

I have an AOR 1000 scanner which goes down to 8 MHz, and I think that
Yupiteru (sp?) have even lower frequency coverage. However, since my
AOR had a top end frequency of around 1300 MHz, it might not prove as
sensitive as others may want... I could hear many European stations,
but I'm in Europe :-) 73 Peter.

Source record: 233619

I am looking to buy a new handheld scanner which will mainly be
used for the 460.000 to 470.000 range. I currently own a very old BC 210
which pretty much does the job I need it to, but is not handheld and does
not have a large enough channel capacity. I am looking to spend as little
as possible, but realize that the $100 handhelds have the same capacity
limitations as my current scanner and do not come with NICAD battery
packs. So far, the only ones I have seen with a higher capacity can hold
100 channels which is more than I really need (about 20-30 would be
enough) and are about $180-$200. The ones I have looked at are the RS 63
and the BC SportCat and another BC that had similar features but I'm not
sure what the number was. Are any of these scanners better than the
others? Are there others I should be looking at?
Thanks,
Zachary Zehnacker
PS - Are there any mail-order companies with better prices for these
scanners?

No it isn't, I just got mine about a month ago and am still having tons of fun
with it.

There's no reason to block the cell phones as the scout doesn't have a speaker
for you to listen in on. You have to have a radio, now you have to get a
radio that has the 800Mhz (or cell phone)

If you are not using an external attenna you should try to connect one to
the scanner. If an external antenna is not an option try to adjust your
position of the scanner relative to your location to see if you can
produce different results.

The problem with using the Scout and reaction tune is that you are
receiving the lower powered handheld unit and not the repeater.
Therefore you only hear half of the conversation! It would be helpful if
you could program either the Scout or the AR8000 to tune to the frequency
that is xxxMHz above/below the received frequency so that you could hear
both sides of the conversion. Each different band has a different offset
for repeater receive/transmit frequencies. But each band has a standard
that could be used as a default.

3750. AR-2800

Hi,I was wondering if anyone out there has a AR2800? I just bought one and I find the manual hard to follow. It says that there is a "priority" and even say it's quite easy to do. The manual says you hit the "AU PROG" button and then hit the Bank button and then the channel number, sounds simple but doesn't work and there isn't a "AU PROG" button just a "PROG" button. Also having problems setting search limits if anyone could help me there. Locking out Banks I noticed I had to do the opposite of what they say to get that function to work. If anyone know if there's another manual out there I sure would like to know as this one really doesn't help me. I've had a number of radio shack scanners and this is my first AOR so maybe I just need to spend alot more time reading and trying this radio out. If anyone could help I sure would appreciate it and if you could e-mail your replys to (abeaton@awinc.com) that would be great.
Thanks for taking the time to read this.....73 Al

3753. FCC Creates New CB Service (FRS) in 462 MHz Band

Newsgroup: rec.radio.scanner
Date: 1996-05-18 00:00:00 UTC

FCC Creates New CB on 460 MHz Band

by Gary Pearce KN4AQ

The FCC has created a new Citizens Band service in the 460 MHz band. It's called the Family Radio Service (FRS), and is designed to be an unlicensed, "Very Short Distance Two-way Voice Radio Service." The FCC Report and Order creating the service was released May 15th, and will become effective sometime in June (30 days after publication if the Federal Register).

The specifics:

FRS will permit handheld operation, with 1/2 watt ERP and "rubber-duck" type antennas only, on 14 frequencies in and around the GMRS radio service at 462 MHz. The exact frequencies are listed below.

No external antennas or amplifiers will be permitted.

To avoid interference with GMRS stations, FRS radios will be required to use only 2.5 kHz deviation, half the usual narrow-band FM deviation of 5 kHz. Transmit audio frequency response is limited to 3.125 kHz.

Frequency stability is tight as well -- transmitters must not drift more than plus or minus about 500 Hz (.00025%). You'll find typical ham radios on UHF up to 1000 Hz off frequency.

Subaudible tone and other selective calling methods are permitted. Autopatch or other telephone interconnect is prohibited.

Antennas must be an integral part of the radio, and must be vertically polarized. (I suppose that means you can't hold the radio sideways while transmitting?)

FRS is an unlicensed service, and there are almost no restrictions on the content of FRS communications.

The FRS channel frequencies are:

Channel No. (MHz)

1..... 462.5625
2..... 462.5875
3..... 462.6125
4..... 462.6375
5..... 462.6625
6..... 462.6875
7..... 462.7125
8..... 467.5625

9..... 467.5875
10..... 467.6125
11..... 467.6375
12..... 467.6625
13..... 467.6875
14..... 467.7125

Complete rules and comments from the FCC can be found on the FCC's Web site, at:

http://www.fcc.gov/Bureaus/Wireless/Orders/fcc96215.txt

My ICR7100 has a function which commits new frequencies to a special
memory bank automatically. I can leave the radio searching and come
back later to check for hits. It only records the frequency once so
the bank is not clogged with hits on a busy station.
Maybe you can get this functon on less expensive radios?
Brian

A word of warning here, some scanners have enough noise in the audio output to keep you VOX triggered all the time. My PRO-34 worked fine with my RS VOX tape recorder, but my AOR1000XLT & PRO-50 kept it going all the time! Even tried using the VOX level adjust and it didn't help much!

That's a timely question.

My Scanner Equipment column in the June 1996 issue of
Monitoring Times magazine is devoted to tips and
modifications for the Uniden/Bearcat BC9000XLT. MT should
arrive at subscribers' homes in about one week. I don't know
when it will reach the newsstands.

Anybody know what freqs. the shuttle Endeavour will be using? And,
will it be receivable pretty much nationwide? (I imagine so, as Nasa
has control centers in both California and Florida)

Please mail and/or post the answers if you know them! Thanx!

David

As I understand it, there will be three basic trunk groups in King
County. Seattle, King County agencies, and Eastside Cities.

I spoke with the coordinator for the King County group and he said
that the various Police agencies involved with his group were in the
process of formulating the policies relating to the sale of these
radios to the general public. He said they should be available around
the fall or winter of this year, providing there are no snags in the
process. You are right about the price tag (pretty steep) and I don't
know if that price covers programming of the radio. Also, I don't know
if the Motorola radio would be able to scan.

The guy I spoke to said they were trying to convince Motorola to
market a trunking scanner to the general public, but so far he has not
heard of any plans in the making. Perhaps if people wrote letters to
Motorola?

Try the following:

Base Handset

46.61 49.67
46.63 49.845
46.67 49.86
46.71 49.77
46.73 49.875
46.77 49.83
46.93 49.99
46.97 49.97
43.72 48.76
43.74 48.84
43.82 48.86
43.84 48.92
43.92 49.02
44.12 49.10
44.16 49.16
44.18 49.20
44.20 49.24
44.32 49.28
44.36 49.36
44.40 49.40
44.46 49.46
44.48 49.50

I hope the above helps.

3767. FS: Bearcat 2500XLT and 220XLT

Newsgroup: rec.radio.scanner
Date: 1996-05-19 00:00:00 UTC
From: rcwalker73@aol.com
Message-ID: <4nn4jo$37g@newsbf02.news.aol.com>
Source record: 233499

I have the following two scanners for sale...

Bearcat 2500XLT - Includes extra battery pack, was recently factory tested and aligned, unit is modifiable for cellular (but hasn't been done). Unit is in excellent condition with all packing, manuals and accessories. Asking $230 + shipping/handling.

Bearcat 220XLT - Like new condition, includes extra battery pack and Uniden case (which wasn't included with the radio). Unit is in like new condition with all packing, manuals and accessories (less earplug). Asking $175 + shipping/handling.

Nothing wrong with either unit, just trying to slim down the number of scanners I have!

: Cordless phones currently have 10 channels as follows;
:
: 30.075 Mhz to 30.300 Mhz in 25 Khz steps.
:
: Previously they had 5, 30.075 Mhz to 30.275 Mhz in 50 Khz steps.

WRONG!!!!!!!!!!!!!!!!!!
Dont give info unless you know what your talking about.
There are ten freqs... but they are in 46.610 to 46.970
I beliebe the channels are
46.610
46.630
46.670
46.710
46.730
46.770
46.810
46.870
46.910
46.930
46.970
I realize this is 11 channels, i am going by memory....

Personally, if I were running the agency I too would say why would the public need to listen? All they do is get in the way, or use it to keep from getting caught in the crime. Not to mention the ambulance chasers, and insurance adjusters that just so happen to appear on the doorstep after the destruction. Also those tow truck drivers that hear the call and show up before the police so they can ream the people to get them off the freeway.

Don't get me wrong, I'm with you, I'd hope they'd re-broadcast on another frequency, but looking at it from their view, there's no reason for them to. It'd be like asking them to tell us what went out on the MDT's.

:>All help appreciated! I just might be selling an AR 8000 if I can't listen
:>to the police any more ;(

If you decide to sell it let me know, I'd love an AR8000.

3772. Info on New Desk Antenna

Newsgroup: rec.radio.scanner
Date: 1996-05-19 00:00:00 UTC
From: phancock@escape.ca
Message-ID: <4nndot$43k@wpg-01.escape.ca>
Source record: 233504

I'm looking for info on an antenna that was reviewed in the April Monitoring Times. It is called the Sky Scan Desk 1300 and the article claims its performance is equal to or better than a disconne. All this from an antenna that is 3 ft tall and sits on your desk. The only problem is it is only available from the U.K. The article gave a phone number and fax number of SRP Trading Co. in the U.K. but the numbers don't seem to be correct.

Anyone using this antenna and if so can you provide info on where you ordered it from.

Hi Brian,
This is just a guess but when one installs the OS456 to the PRO2006 you
solder a wire to the top of Test Point 2, TP2, where the wire protrudes to
get audio to the OS456. Try it to get better audio to the Tracker.
On the PRO 2005 it`s Pin9 on IC2.
Let me know how it goes since I am also planning on getting a Tracker.

Cheers,

Rickard.

3776. Swap/Trade Ideas

Newsgroup: rec.radio.scanner
Date: 1996-05-19 00:00:00 UTC

Source record: 233508
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I want to swap new CE-232 Scanner/Computer Interfaces in
either of three forms:

- Kit of all essential parts, disk, manual, tech support
- Assembled/Tested board with disk, manual, tech support
- Installed, setup, tested in your scanner

The Basic Kit is valued at $195 and the assembled/tested
version is valued at $245. Full installation values start
at about $350 and go up, depending.....

But I am in the mood to horsetrade for late model computer
peripheral stuff, including but not limited to the following:

+ hard disk drives, IDE or SCSI
+ removable high density storage devices/media
+ RAM memory SIMMs
+ video and other controller cards
+ SVGA monitors
+ Network Interface Cards
+ motherboards & CPUs
+ PS/2 and other bus mouse cards/pointers
+ Laser/inkjet printers
+ Hmmmm whaddya got?

I am not interested in junk, old stuff, basket cases, and
"collector's items". Only modern stuff in good working
condition.

I am also interested in acquiring defective PRO-2004 scanners in
clean condition for my parts inventory.

Contact me by e-mail if you're a hoss-trader.....

Rgds,

Bill

No way.
Motorola is is the business of making money.
That do this by convincing people that these groups are impossible to scan. Bull shit. It can be done, you just needa bit of patience, it can be done.
Possibly with new equipment.

> Falcon54

Some additions:
The normal diamond formation uses 141.850 A.M. (Victor 1) While the Solos use 322.950 A.M.(Uniform 1) Ground crews use either 413.025FM or 413.100FM. There are other frequencies used by the grop but in the last 10 times I've seen them, (Including Mesa tis year, these are the only one I've heard.

See you down there!

He didn't elaborate. He just said he was listening to some of the
employees on the scanner while at Universal Studios, and a security guard
kicked him out because of it. Read the "NE1 get in trouble for scaning??"
thread to see his post and subsequent comments.

902-928 in 25khz steps, and for normal cordless, don't search 49-50,
you'll probably get nothing (only most of the handsets fall in this range)
instead search 43.72-46.97 for the base freqs. the 900mhz phones I have
seen automatically switch channels, and either the base or handset fall
into 902-928.

>25 Khz steps using FM only.

Are you sure you aren't thinking about the GMRS band?

There are two main frequency pairs, 462.550 MHz - 462.725 MHz in
25 KHz steps and 467.550 MHz - 467.725 MHz in 25 KHz steps.
Up to 50 watts is allowed on these frequencies, 8 pairs altogether.

There are 7 more frequencies between the lower frequencies, 462.5625
MHz - 462.7125 MHz in 25 KHz steps where up to 5 watts ERP is allowed.
This is the area Radio Shack would like to be unlicensed for use as
what they call a "family band". So far a license is required to use
any of the frequencies. The band is intended for personal use.
I've been running a couple of handhelds there for a few years now.
Only problems have been the pager transmitters as far as interference
goes. I seldom hear anyone else.

Since you've graciously allowed me the opening for a plug, I
should point out that the Upstate guide has been in print for almost 2
years. ANY scanner book is somewhat outdated by the time it hits any
store shelves. The next edition should plug the so-called holes.

And by the way, just what do you think was missing? I credit
those who contribute useful information in my books. Your buddy just
plagiarizes.

Well, Jim (probably your real name) do you remember being forced
to remove your homebrew guide from store shelves a couple of years back
in order to avoid prosecution under USCA Title 17 (Federal Copyright
Act)???

And if you're not actually Jim Sutton hiding behind another
AoHell stage name, why don't you ask him about that little factoid, eh?

FYI:

If you want a "CHP detector", chances are you already own one. I have saved myself many a court appearance in the Golden State by listening to 154.9050 mhz as I drive. When the signal is loud and clear, you can bet the rent you are within 1/4 mile of a CHP unit. Works especially well in urban areas where there is a lot of radio traffic.

>
>--Adam

Adam,

Dont know about the SC150, but here goes "images 101":

Most scanners use a dual conversion method to tune frequencies. A local oscillator(LO) is tuned to the desired frequency, minus the intermediate frequency(IF),usually 10.7 mhz. The scanner then mixes the LO with the IF to produce 4 seperate harmonic frequencies, one of which is the IF. The scanner circuitry then amplifies the IF only. This is the first conversion. The scanner then feeds the IF to a second IF, usually 455khz or so, completing the second conversion. This allows the scanner to pick up just your desired frequency among the thousands of signals coming in. There's more involved than that, but this is all you really need to know to understand where the image comes from. The key is the IF.

Now, lets use an example, which I have shamelessly stolen from Police Call. If you tune the scanner to 474.4000 and that scanners' IF is 10.7, the LO is set to 463.7000. A strong signal from 453.0000 will get thru the filters in the scanner and also mix with the LO to produce 10.7, our IF: 463.7000 - 453.0000 is 10.7. Then our poor confused IF is amplified as usual and the "image" is born.

If you notice, the image of 453.0000 is exactly 21.4 mhz higher - 474.4000. In any dual conversion scanner, you can tune an image by adding 2 x IF to the frequency.(2 x 10.7 = 21.4) The owners manual of your scanner will tell you what the IF is.

Hope this helps, I tend to ramble on sometimes.

Later,
-Phil

3795. Who knows about the PRO-25?

Newsgroup: rec.radio.scanner
Date: 1996-05-19 00:00:00 UTC
From: Phil Smalley <psmalley@primenet.com>
Message-ID: <4nohr1$l9h@nnrp1.news.primenet.com>
Source record: 233527

Hey all,

My Pro 50 just wasn't doing it for me, so when payday came I wandered down to my local Radio Shack and checked out what they had. I noticed that the PRO-25 was on sale, and after examining the scanner's channel layout and band capability I was sold. This thing blows my old scanner away! I thought, and I bought it that day.

Well, blow away my old scanner it does! I now have 10 monitor channels, 800mhz and vhf air, and 80 more channels to play with. Plus this bad boy scans at 50 channels a second! I know that isn't top of the line, but for $200 I'm quite pleased with this little guy.

Just for fun I thought I'd check the newsgroups for mod's, as Cellular and more channels would put the icing on the cake. Guess what I found - nothin'! Oh well, thought I, it's probably too new for those yet. I went to Tandy's web site for specs, and it isn't there either! I think I found the Uniden version on their site, but theirs has more goodies on it than this one.

Anyway, I will say this: I like this unit and I'd recommend it to anybody who doesn't need shortwave to microwave continuous, but doesn't want the el cheapo 20 channel either. If anyone knows more about this scanner, mods and/or spec's I'd appreciate it! The manual doesn't provide alot of technical stuff, and I've misplaced it already anyway.

Thanks,
-Phil

CHRISTOPHER T NICHOLS (ctn3904@uta.edu) wrote:
: Does anyone know of any music being played on SCA in DFW?

Most every population center will have Muzak on at least one SCA. Even though the emphasis today is on satellite distribution, there are TONS of older installations which use the SCA and they don't want to retrofit them. I believe that Muzak is on 105.3 and some competitor (perhaps AEI or 3M) is on 94.1. Both have two subcarriers, and instrumental channel on 67Khz and light rock on 92Khz.

However, sound quality is atrocious with SCA decoders, especially with homebuilt ones. Good sound requires an outdoor antenna and an expensive receiver designed for SCA reception. Also, this music is designed to be played at a low level anyway so audio quality is not that important. Muzak uses a squelch mechanism which is very tricky and has been rumored to have been set up to make it hard for people to pick up their signals unauthorized. You get a burst of loud hash between music segments.

If you want commercial-free music, I'd suggest getting a DSS or some other type of small satellite dish, you get digital audio quality and a wide variety of music choices. The cost of the music channels is next to nothing. In another couple years, there will be radios with 3-inch satellite antennas which will play commercial-free programming.

Date: 1996-05-19 00:00:00 UTC
From: glenmack@stevie.powerup.com.au
Message-ID: <4nm2r5$c8e@grissom.powerup.com.au>
Source record: 233584

Does anyone know of any mods for the Uniden 9000xlt? or does anyone have
any new keypad tricks for this model?

3807. Images and the SportCat

Newsgroup: rec.radio.scanner
Date: 1996-05-19 00:00:00 UTC
From: Beeker Bunson <adamb@rockland.net>
Message-ID: <319E8202.3EBD@rockland.net>
Source record: 233585

Can someone please explain "images" to me. I have been told
that it's like recieving something 20 someodd mHz above the real
freq...?

if this is true, is it also true that it only works in certain radios?
why? does it work in the Sportcat (Uniden SC150)?

also, are there ANY mod's for the sportcat? I'm thinking of buying one
(actually, i;m almost set on it), and don't plan on modifying it (b/c
i'd probably brake it) but it like to know what it CAN do.

please reply via e-mail AND post if possible.

Regarding the legality of monitoring Mobile Data Terminals:

It is not illegal to monitor MDT's, unless the data is specificly encrypted. Just because it is in a format that is not commonly available on todays radios doesn't mean that it can not be monitored legally. The question will not be one of ECPA, rather it will be one of intelluctual property (The software that runs the system is undoubtably copyrighted, to break the system without violating copyright will be difficult).

The biggest problem you will have with monitoring MDT's is how to choose the data you want to read. Most busy systems will overflow your buffer in seconds. Unless you were to emulate a specific terminal, then you would be inudated with all the traffic over the system. By emulating a specific terminal, you would receive only the traffic sent to that specific terminal.

(phreex) wrote:

** I got kicked out of Universal Studios for scaning in on there freq's
Can they
** do this??, what are your rights as a scanner??

I am not an attorney, but my understanding is this:

On private property, the owner or agents may remove you if they please for whatever reason. In this instance they may be obligated to return your admission fee, unless you violated a posted rule.

If they have no posted rule against scanning, then they would probably be liable to refund your admission. If you wish to contact an attorney that practices law in CA (or FL, depending on which park you were at), they would be able to tell you for sure.

Private security guards may not enforce state, federal or local laws unless they or their employer is the victim of your transgression. Another exception may be if they are sworn by a law enforcement agency. Therefore, Universal Security may not enforce a scanner law (if one exists) unless they can show that they were victimized by it, and it caused harm.

I stopped at the local radio shack outlet store here in Dayton.
The manager I spoke with told me I just missed the PRO-43 for a
clearance price of $124.00. He said they had a handfull or so to
sell at the hamvention but had just shipped them out that
morning. Did anyone happen to pick up one of these or see them
at the show.

The unit cannot be modified for cellular, but you can receive it as an
image above 894 mhz.
In my opinion, it is the best mobile scanner available for the traveler.
The monitor (CHP detector) will work off the "mobile extender"
frequencies allocated to the HP. That is when a trooper's walkie talkie
uses his/her car tranceiver as a repeater. It works!
A good price on the unit is $169 or $159. Look around and ask for
quotes before you buy!
Good Luck

If you can, check the date of manufacture. If his serial number is
below yours, it may have been manufactured before April 1994, and yours
after. Looking through the mod sheets, there were 3 different versions.

Speaking about the two diodes behind "3" on the keypad inside the unit,
one opens up the cellular band, the other will increase the scan speed.
Don't remember which one.

I would like to see both newsgroups continue with rec.radio.scanner
being the more `mainstream' group and alt.radio.scanner become more
dedicated to `unusual' topics.
rec.radio.scanner could cover monitoring police, fire, EMS and
aircraft.
alt.radio.scanner could discuss topics like cellular phone, cordless
phone, fast food, POSAG, GOLAY etc.
Other users have any input ?

3823. BC2026 mem loss

I work security for Sears, and we do not have arrest powers, but we do have detain powers. So, with shoplifters, we don't actually arrest them, we merely apprehend them and hold them until the police can arrest them. So, with the security guards at Universal Studios, if there is a law against scanning wherever you are at, they could have detained you for the police. By the way, how did they know you were scanning? Please tell me you didn't go walking into there holding your scanner in your hand, out in the open! They probably thought you were a terrorist or otherwise planning to do something destructive. They don't understand that scanners just "receive" and do not transmit. Actually, I bet someone else there reported you as being suspicious.

WRONG!!!!! You should take your own advice!! The proper frequencies
are as follows (Note: there are now 25-NOT 10 or 11?)

:

NOTE: Channels 16 through 25 are identical to the old 10 channel
system.

BASE HANDSET

Channel 1 43.72 48.76
Channel 2 43.76 48.84
Channel 3 43.82 48.86
Channel 4 43.84 48.92
Channel 5 43.92 49.00
Channel 6 43.96 49.08
Channel 7 44.12 49.10
Channel 8 44.16 49.16

Channel 9 44.18 49.20
Channel 10 44.20 49.24
Channel 11 44.32 49.28
Channel 12 44.36 49.36
Channel 13 44.40 49.40
Channel 14 44.46 49.46
Channel 15 44.48 49.50
Channel 16 46.61 49.67
Channel 17 46.63 49.845 #
Channel 18 46.67 49.86 #
Channel 19 46.71 49.77
Channel 20 46.73 49.875 #
Channel 21 46.77 49.83 #
Channel 22 46.83 49.89 #
Channel 23 46.87 49.93
Channel 24 46.93 49.99
Channel 25 46.97 49.97

= 49.83-49.89 freqs commonly used for baby monitors.

: D. Stark,
: If you would make the purchase of the Police Call directory most all the
: frequencies you are looking for are listed. I believe the book sells for
: around 9.95. The book is available through several radio sales companies
: which are listed in Popular Communications magazine.
: Jim
: N3BRS

Police Call is $12 something now (Police Call Plus).
You would need to buy 4 of them:

Vol 1 - NY
Vol 2 - PA/MD
Vol 3 - OH
Vol 6 - WV/VA/NC/SC/GA/FL

Total Cost about $50.

Why not buy Monitor America which lists all this info in great detail or use the resources at your finger tips and search the WWW. Mr. Stark and quite a few others have put together some sites that well, are probably more up-to-date than most publications *and* aren't just frequency dumps along with a service code. I assume you have never visited some of the better WWW scanner related sites or for that matter seen a copy of any scanner master publication in particular their "big books".
Police Call does have its place and is useful but judging from how much I use it compared to Scanner Master it isn't even touched 1% of the time.

If someone is new to scanning, these books will give them a big jump ahead and keep them in the hobby, because %99 of the information is right there.

I'm not affiliated with Scanner Master (1 800 722 6701 for catalog)

Carter

PS to all those with WWW sites keep up the good work and thank you.

In Mr. Stark's defense -- _every_ scanner book out there (I have 'em all!) has holes in it. Police Call has
'em because they only publish current FCC data (expired licensee's are not included even though they may still
be transmitting). Stark's book, from what I know, is mostly a collection of verified listening reports, reader
contributions, past listings circulating out there, etc... However, it is _the_ most comprehensive book
covering upstate NY.

For my personal use, when I have a few hours to kick around and do nothing, I'm taking what I have from his
book, Police Call, Beyond Police Call, my personal information, and listings that I have downloaded over the
years, and combining all of the Rochester area data into a single database (Dave - interested? Just
concentrating on business band stuff for now). Fills in the holes quite nicely.

> Well, Jim (probably your real name) do you remember being forced
> to remove your homebrew guide from store shelves a couple of years back
> in order to avoid prosecution under USCA Title 17 (Federal Copyright
> Act)???

Is this the same guy that basically "cut and pasted" one of your older books and resold it for like ten bucks?
I remember seeing one in World Wide News some time ago -- looked like a tenth generation Xerox job.

BTW - you doing the HamFest at the end of the month? I'll be setting up a table on Saturday -- mostly used
computer stuff, some two-way equipment, books, etc...

Scanners generally receive frquencies above 25MHz in narrow-band FM mode,
except that some use AM to receive the aircraft band 108-136 MHz.
SW receivers often do not include FM, but always include AM with reasonably
narrow band filters. The more sophisticated ones also receive
single-sideband, code, radioteleprinter, facsimile and other
transmissions in the 1.7-30 MHz frequency range, and usually cover
broadcast and maybe long wave.

Well, usualy I have a hotel room somewhere near the park. When I leave to rest or whatever, I can whip out the scanner/ht and listen in. It doesn't mean that we sit in the middle of the park and tune in. Too much other stuff to do. Just adds more to the list of possibilities.

>Dunno. I was listening in on the tower frequency (118.5/120.05 for St.
>Louis).

Air Force One landed at the Boise (ID) Airport on Feb. 14th of this
year, due to massive flooding in northern Idaho. Lots of activity on
both 407.850 and 415.700 as well as the local approach/depart and
ground control freq. While doing a search in the 407-416 area I did
not hear or listen to what sounded like conversations between
staffers and the whitehouse.

Also heard 3 or 4 Secret Service frequencies in the clear, and 3 or 4
more which were obviously scrambled.

I don;t know who was more excited about this scanning opportunity, me
or my 8 year old son!

No law against scanning anywhere in the US that I know of. Just against
listening in on cordless and cellular calls. Sounds like the guy scanning
in Universal wasn't detained, arrested, or charged with any crime. Just
"asked" to leave. That is quite different!

I can go into a fine restaurant, talk loudly and make rude gestures, and
be asked to leave, even though I have committed no crime.

phreex (phreex@worldramp.net) wrote:
: I got kicked out of Universal Studios for scaning in on there freq's Can they
: do this??, what are your rights as a scanner??

This is an outrage. I would be totally upset had it been me. This
is a perfect example of fearing something that you do not understand. Too
often organizations don't understand technology, and tend to lash out the
second they feel 'something suspicious' is going on. The government/police
is the same way. Take action first, ask questions later.

Yes, I understand private property is private property. Rules must
be posted. I highly doubt there was any 'no scanning' signs posted. I
could understand management questioning a person as to what they are doing
and even asking a person to put it away/back in car/etc But removal from
a park is outrageous.

It's a shame that we need to 'wear baggy shirts', and 'use a earpiece'
or 'wear a light jacket' while we conduct ourselves in a LEGAL MORAL AND
HARMLESS activity. It's funny how security guards/police have time to
bother law-abiding citizens, but are 'limited by manpower' when it comes
to the war on drugs. Give me a break.

Keith

I scan at Disneyland frequently and have never had problems. Keep the
volume down (or better yet, use an earpiece) and don't draw attention
to yourself. Transmitting (I'm a ham) is a different story, and I
don't recommend it.

3865. Slight URL change for my Radio Page

Newsgroup: rec.radio.scanner
Date: 1996-05-20 00:00:00 UTC
From: thharrel@cs.nmsu.edu
Message-ID: <4nq1kc$l6b@bubba.NMSU.Edu>
Source record: 233481

Over the weekend, my ISP (ZiaNet) moved all of its web pages to a dedicated web server. The good news is that it should be more dependable than the old server was, and that the URL is a bit shorter. That's also the bad news - the URL has changed.

The new URL of my Radio Page is

http://www.zianet.com/kc5kto/scanner.html

If any of you have pages with links to my Radio Page, please change them - the old URL seems to be broken permanently.

Thanks,
T.J.

I have BC200xlt scanner that I thought the battery was shot (7 years old). Even when plugged it seemed the scanner wasn' t getting the correct power, even after charging for hours it would shut down as soon as power was removed. So I replaced the battery pack (BP200). It turns on fine, scans fine but there is NO SOUND! Even with the earplug, NO SOUND! I just wanted this to last a little longer until I scrape up the cash for a newer one.
Anyone have any ideas what the problem and/or remedy is?

Thanks in advance,
Mark

First off, I am not Jim Sutton, nor have I ever met the man. Your book stunk because you missed some of the most basic frequencies in Western New York and their usage. I'd provide you with a detailed list but even at 45 wpm I would rack up a sizeable AOL bill should I decide to do it while on line.

Second, I know the story about you forcing Sutton to take his book off the market . Some nice guy you are! The proceeds from his book were going to support a Christian youth group that Jim is involved in. Gee, how much of the profits from your book went to charity?

Quite honestly, I would hope Scanner Master would see your book for the dog it is and discontinue it! Anyone who bought it should be given a refund. I still maintain that Sutton's book makes yours look like a sick joke.

>
> Grove Electronics does both of these mods so I know they are possible.

I checked Grove's web site, and sure enough, they charge $40 for
a "cell mod" on the PRO-2021. From everything I've heard, although
the 2021's CPU can indeed scan through the 800MHz band (and can
be modified as per the mod file on oak.oakland.edu to do so),
the scanner has no circuitry capable of receiving signals up there,
so it wouldn't ever hear anything. Surely Grove wouldn't charge
$40 for a mod that doesn't do anything?

I've often wondered if the GRE Superconverter (or even the Ramsey
unit, etc.) could be internally mounted in the 2021 and modified to
switch itself inline as an additional IF stage every time an 800MHz
signal is scanned by the CPU. It'd make an interesting experiment.

Hi All,

I have an ICOM R100 communications reciever for sale, in great condition. Includes book, box, antenna, power cable. Covers .1 MHz to 1800 MHz, including all of the 800 MHz band. Modes are AM, FMN, FMW, 100 memory channes, preamp / attenuator, step size adjustable, VFO knob, clock, AFC, NB, etc etc.

Asking $425 shipped Fed-ex Overnight.

I would consider a mobile scanner for partial trade (Bearcat 760XLT).

Message-ID: <4nocto$788@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 233536

There are several models on sale right now. But the ones I'm interested in are the PRO-25, PRO-51, PRO-60 and PRO-62.

The PRO-25 was $200 and the PRO-60 was $250. The other models were somewhere in between that. The sale(s) end soon.

FWIW, the sales guy said he was into amateur radio and really like the PRO-51.

Does anyone have any votes for the above models? Bear in mind, I don't know a lot about scanners. (Yes, I've read the FAQ and lurked for several days.)

TIA!

Of course, as we all know, the day the law was passed, everyone who
had a cellular-capable scanner immediately STOPPED listening to those
freqs, and all discussions on opening up the cellular receive is for
PURELY educational use only. Right? hehehe ;-)

No, no, no, no, NO. Do we have to go through all this again?
The only "law" involved with HARDWARE, is that the FCC will no longer
certify the manufacturer or importation of scanners which will receiver,
or can be easily modified to receive the cellular bands.

It is NOT illegal to buy, sell or own such a scanner. It *is* illegal
to actually listen to the cellular phone transmissions.

You know, I 've done this in the past and it works really well, even without a COR. You can buy
tapes that run for 8 hrs in SLP, and when are you ever away nuch longer than that?!

The only drawback is that there is no way to FF through the tape to hear where there has bee
activity-this is where the COR is necessary.

Mark:
While I have not had this problem with my BC200xlt, I have had it with other _older_ BC units.
It seems that with time, the springiness of the contacts in the earphone jack socket tend to lessen, causing poor (or no sound) when the earphone jack is withdrawn.
Additionally, the contacts do get dirt/corrosion on them and can also not make good contact with or without the earphone.
Suggest you turn your scanner off, moisten the earphone jack with rubbing alcohol and repeatedly insert and withdraw it from socket.
Blow it out as best you can, _give it plenty of time to dry_ and see if you can now get sound.
If this doesn't work, you'll probably need to send it to a competent repair facility for electronic checkout and repair.
Good luck.
Temp

False, unless the "etc." includes LISTENING to cellular and cordless
phone calls, in which case it is true.

As far as the consumer is concerned, the ONLY illegal act in regards
to scanners is listening to cellular and cordless phone calls.

> In frosty Canada, here, anything goes.

...except knowledge of U.S. scanner laws.

> Move north eh?

To listen to cellular and cordless with impunity and do some terrific
fishing? Done deal!

3893. AR-3000 to AR-3000A Conversion

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: Vance Socci <vsocci@best.com>
Message-ID: <31A205AE.4A0@best.com>
Source record: 233351

Hello all,

I'm looking for someone who can help me with a problem I'm
having in trying to upgrade my AR-3000 to an AR-3000A.

I have access to some AR-3000A CPU boards and had hoped that
I could replace my old CPU board in the 3000 with a new one
and get the added benefits inherent in the 3000A.

Turns out the board *almost* works, but something is wrong
in the power cycling. The scanner won't power on properly with
the 3000A board - but will come up and operate properly if
you press the hardware reset button on the CPU board. Of course,
all your memories are gone after doing that, so it isn't a practical
way of bringing the beast up.

So, undaunted and encouraged by the fact that the serial protocols
to the shift registers on the RF boards didn't seem to have changed,
I bought a rather nice but pricey service manual for the 3000A and
also verified with Ace Communications that none of the CPU board signals
had changed between the 3000 and the 3000A.

The "power switch" on the front of these radios is actually only
a signal to the processor. (That's why the radio continues to
run in sleep mode even after you turn the power switch off, btw).
I'm getting 5V to the proper pin on the CPU board when the power
switch is turned on, but the CPU won't send back the signal to
fire up the 9V power supply for the RF boards. I don't see what
it could be waiting for either: the only inputs to the CPU board
I know of from the RF board stack are 2 PLL lock signals and
the signal level. So, there's nothing for the CPU board to wait
for before it can go ahead and fire up the power supply and
initialize properly.

I've been assuming that the RS232 remote
stuff isn't the problem; I've been using the old one that
was originally in the AR3000. (The new one is a little different;
it has the remote on/off switch). I tried unplugging the connector
leading to the RS232 and it still acts the same way. I even tried
putting 5V on the pin that would normally have 5V when the remote
switch is turned on, but still no effect.

In an act of desperation, I applied 5V to the data *output* that
goes to the shift registers on the main board, and the CPU
did come up *without* being reset a few times! I haven't been able
to reproduce this behavior though . . . and I don't see how

the data output to the shift register should affect whether or not the processor comes up.

I was thinking that perhaps they moved the pullup resistors from the CPU board in the 3000 to the main board in the 3000A for the serial or clock lines, but I still can't see why that would cause the CPU not to come up . . .

Any help with this will be appreciated. If I can get this working, my friend who has a pile of 3000A boards and cases and I can offer upgrades to any of you 3000 owners with the resulting improvement in radio performance. If not, its back to the old 3000.

Thanks!

3898. Opto Xplorer

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: Harold Hackman <hhackman@earthlink.net>
Message-ID: <31A224CD.6F10@earthlink.net>
Source record: 233356

I saw a beta version of the Xplorer at the Hamvention in Dayton over the weekend. Very impressive! Two things stood out to me in the beta version; the audio capability deletes the necessity to carry your scanner with you for Xplorer activity and the sound is not loud enough (although you'll probably be using an earphone anyway). It's a fairly big box to hang on your belt. The Hamvention price was $850 if you ordered at that time.

3899. PRO-43 battery life

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: sprouse@pgh.net
Message-ID: <4nt7sj$gda@dropit.pgh.net>
Source record: 233357

What kind of battery life are you PRO-43 owners seeing from your radios? I was hoping to get 8 hours from a single charge but so far that has not been the case. I am using Radio Shack batteries (mistake?) and charging them for about 12 hours. I only have a few charge/dischare cycles on them so maybe it will improve. I know the old rule for commercial portables was 80/15/5 for an eight hour shift. (80% squelched standby/15% receive time/5% transmit) With the channels I am monitoring I would guess the radio is seeing something like 70/30 while in use. (70% squelched/30% receive) Great little radio, just needs a bigger battery pack.

>listening?

Shortwave was a term referring to the "high" frequency bands at the
time. It includes from the top of the AM band out to 30MHz.
Shortwave recievers historically cover only these bands.
Scanners were meant to cover the hugh bandwidth from 50MHz to
400+MHz. Now technology has allowed scanners to cover beyond the
traditional. Most common coverage is still 50MHz to 1000MHz.

Put up or shut up. I've been scanning for over 20 years and there are
no missed "basic frequencies" in my book. Show me where I'm wrong.

> Second, I know the story about you forcing Sutton to take his book off the
> market . Some nice guy you are! The proceeds from his book were going to
> support a Christian youth group that Jim is involved in. Gee, how much of
> the profits from your book went to charity?

Let me get this straight. It's perfectly OK to support "Christian"
organizations with proceeds from a crime. Is that what you're saying? Copying
someone else's published work and selling it is a CRIME. The courts don't
care what goody-twoshoes laundering is going to happen to the proceeds, and
neither do I. A crook is a crook regardless of his religious affiliations.

> Quite honestly, I would hope Scanner Master would see your book for the
> dog it is and discontinue it! Anyone who bought it should be given a
> refund. I still maintain that Sutton's book makes yours look like a sick
> joke.

Here's the sick joke, buddy. Jim Sutton's book is a XEROX COPY OF A
BOOK THAT I PUBLISHED IN 1989! I have the proof, and the letters exchanged
about the matter, right here in my file. Wanna see?

To the rest of the newsgroup members - I'm sorry to have subjected you
to this crap. Any further responses that I may bother to make to Mr Scan99 will
be in private email. I couldn't stand to let the bullshit go unchallenged at
the start, but Scan99 is a liar and you've all seen it happen right here. I
don't need to expose him any more in public now - he's done himself in for me.

new to group, so be patient.....

is there a faq for radio scanners???

thanks

3916. AR950 questions

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: kb2rmi@pop3.frontiernet.com
Message-ID: <4nr676$692@cheatum.frontiernet.net>
Source record: 233406

I would like to know some things about the AOR AR 950 scanner.

What are owners impressions of it? How is it compared to the R/S and Uniden stuff?

Are there any mods out there for it?

And finally, what is the market value for one in excellent cond.

Email replies would be appreciated.

3917. Need Scanner Advice

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: davidm@shell.portal.com
Message-ID: <4nr8t1$s92@news1.shell>

All:

When did Radio Shack start making scanners that the
current listed cellular mods would not work with?

Are there any particular favored Radio Shack scanners
to find? Handheld and/or base/mobile?

I've sought advice from several local people I know
but because our schedules are so different I cannot
get the info I need from them and have tried
often with no luck. So I am once again casting out
to the net for this info! :-)

Thanks!

3918. WANTED: FREQ LISTINGS

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: davidm@shell.portal.com
Message-ID: <4nr936$s92@news1.shell>
Source record: 233408

All:

Is there somewhere on the net that I can go to gather
information about frequently used frequencies? In
other words what freqs are used by whom and for what.
I am especially interested in the South East Texas area.
Particularly around Houston. A local person I met has
the info, but they appear VERY reluctant to share. So
I am hoping to compile my own information from the
internet. I'll post it to my WWW page for everyone to
share. If you can help me to compile this information
please do so! I need to find the info as I am tired
of asking for it from the local person I know.

Thanks.
David

An "expert" is a person with a briefcase over 50 miles from home. :-)
Since I'm at home and my briefcase is in the other room, let's just
say I've been a radio hobbyist for over 25 years. Maybe that level
of experience can help you a little bit.

In article <4mrhea$11s_001@nitecapt.li.net>, nitecapt@li.net (NiteCapt)
wrote:
>I currently have a RS "All Band Ground Plane Antenna" (RS20-014) on my roof

>about discones, I wonder why they would recommend the scantenna over a
>discone? I want an antenna which will cover the whole spectrum from 25-1300
as

Why? The discone is the most over-rated of all scanner antennas. It's
sort of the concept the "the jack of all trades is the master of none."
It does a fair job on a lot of freqs, and a good job on few. At best it
performs about like a 1/4 wave antenna, and on many freqs it doesn't even
perform that well.

The Scantenna and the Monitenna (by Channel Master) are optimized for
performance on the scanner freqs. A lot of people around here use the
Monitenna and are very pleased with it.

>information sake, I live in a Valley (at the bottom) and have very poor line
>of sight even with the antenna high on the roof. In any case, I have also
>contemplated a beam like the Grove Scanner Beam but I wonder how much you
lose
>on the back side of that antenna if you don't use a rotor with it. So...my
>questions are as follows: 1.Is the coverage area on beams generally 180
>degrees? 2.How will they pick up...say...the 45mhz frequencies when they
come

Although a beam will pick up "some" signals from all sides, typically
their optimum "beamwidth" is in the 8-12 degree range, and the signals
from the "backside" are in the range of 30 db lower (quite substantially
lower than the front).

>from the back end of the antenna. 3.Will they pick up from the back end
better
>than an omni directional like a discone or the scantenna? 4.Can anyone

No. For "omnidirectional" coverage with a pattern that "favors" one
specific direction, you can combine a beam with an omnidirectional
antenna, feeding them into the scanner together. There have been articles

about doing this in both Monitoring Times and Popular Communications.

advise
>on the virtues of the discone vs the scantenna vs the RS I have? 5. Can
anyone >suggest an even better omnidirectional antenna?

A discone might possibly be worse than what you have (my father has the
same antenna you have, and it's not that bad). A Scantenna or
Monitenna might be somewhat better, but I'd be surprised if you were
overwhelmed by the improvement. A beam COMBINED with your current
antenna might well be the best.

BTW... what type of coax are you using and how long a run do you
have? At the VHF/UHF "scanner" frequencies, a long run (say 50 feet or
more) of coax like RG-58 is signal "sponge", "soaking up" the
signal before it can make it to your scanner. And the higher the
frequencies you are listening to, the worse it gets (i.e. worse at
460MHz than 155 MHz, almost useless at 800MHz). If your antenna is a long
way from your scanner, you best investment might be to upgrade your
feedline.

3926. Sport Cat 150B on Sale!

Newsgroup: rec.radio.scanner
Date: 1996-05-21 00:00:00 UTC
From: mervins@aol.com
Message-ID: <4nrmc4$ca2@newsbf02.news.aol.com>
Source record: 233416

For those residing in Northern Virginia, the BEST's in Sterling has the Sport Cat 150B on sale for $143.90 {reference retail is $239.50}. In addition, if you charge it no payments are due until September.

This price may be available only at this store. I checked with another BEST's and the price was $199.99. Don'y know how long the sale lasts.

No yellow models available. Price includes nickel cadmium batteries, AC adapter, earphone, clip and frequency manual.

I bought the Pro-25, too, and it's a real nice unit. Thanks to its
dual-conversion circuitry it will pick up cellular frequencies as
images in the 896-920 MHz range.

I don't care about cellular much, but I'm thinking that I should have
spent the extra $$$ and gotten a Pro-26. Full frequency coverage to
1300 MHz, just think of it. I want more!

Guess I'm hooked.

Go to my links page, then follow to Per Con and do a search for some of
those freq's.

Or open the attached file. These are real freq's. I have tried them and
crossed them with the lastest Police Call book.

The same time all other manufacturers did! After the cell ban law past (ECPA or something like that).

>Are there any particular favored Radio Shack scanners
>to find? Handheld and/or base/mobile?
>
If you're interested in cellular coverage, it's cheapest to find a used one in good condition (RS, Bearcat, AOR, ICOM). New ones that are still modifiable are quite expensive (AOR, ICOM, perhaps some others) and the mod price is $50+.

>I've sought advice from several local people I know

Source record: 233428

FIVE REASONS *NOT* TO BUY THE SOUTHWEST FREQUENCY DIRECTORY
(SWFD) BY DAN ROLLMAN
---

1. The author will only be friendly because he wants your money.
2. The SWFD is WAY too expensive. The value of each book is only about $5.
3. Any frequency you want to know may be found somewhere else for FREE, or
A LOT cheaper than the SWFD.
4. The author may have the latest complete lists from the FCC, but these
are only licensed companies, and at least half of the most interesting
things to listen to are NOT licensed.
5. If you want a complete list of frequencies such lists may be purchased
from several companies for about $20 per state. Don't pay $30 or more
for the SWFD, it isn't worthy of being called a comprehensive frequency
directory.

While this is really not the proper news groupd, are you interested in
HF/SW fax, or weather satellite fax?
FTV-DEMO is at funet.fi and should be at
http://www.lookup.com/Homepages/79251/home.html
or http://www.geocities.com/SiliconValley/2504
WXMAN 2.0 is also at funet.fi
Channelx is also at funet.fi
All of the above use the SoundBlaster(or true compatible sound cards).
FTV costs $10 to register, the demo program recieves but will not save.
FTV is great and gets both HF and WX sat fax.
WXMAN 2.0 is HF only and the demo version will save images.
Channelx is freeware(I think), but the documentation is in Finiish.
Channelx is for wx sat fax only.

AMSAT and DRIG both have SBDSP11 and APTCAP40. These should allow you
to record a pass as a voc, use a voc to wav converter, run that thru
SBDSP, and view the result with APTCAP40. SBDSP11 has a GOOD tutorial
on wx sat reception. I have not have verry good results with SBDSP11
and APTCAP40. But lots of other people get good images all the time
with these programs. SBDSP11 is for satellite fax reception.
IF you are up to building a simple interface, there are two good programs.
Hamcom (3.0?) and JVFAX 7.0 or 7.1. These last 2 programs have good
documentation with JVFAX 7.0/7.1 getting the edge here.
Good luck

Source record: 233436

I didn't catch the first part of this thread, but I am guessing that it had to do with trying to record the freq along with the activity on a scanner.

The Mac program "WAVE" by Mike Wingstrom (MikeASL@AOL.COM) will provide a verbal announcement of the frequency received on 1 audio channel, which will allow one to record the scanner audio on the right channel and the frequency announcement on the left channel.

WAVE runs the OS456 or OS535 units. It requires any Mac above a Plus, System 7, and Speech Manager (For the freq announcement) A steroe recorder will allow the seperate audio channels or they can be mixed as one channel.

I was talking with someone from Japan who said there was another DS8000 equivalent (non AOR mfg.) which has 16 tones. The AOR DS8000 has only 4 tones. I'm wondering if there is a mod to the DS8000 that will give the full 16 tones?
The eqivalent DS8000 (non AOR) has a tone for each letter.

Ken

If you live in Massachusetts, you can join the localized
mailing lists I've created. Both lists have gray areas around
them, so we do discuss areas outside of the primary regions.

(These lists are meant as regional alternatives to the)
("scan-l" mailing list which is nationwide.)

scan-mass-east

This list covers all of Eastern Mass from West of Worcester
to the East right into the water.

To subscribe to this list, send a message like this:
To: scan-mass-east-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-east-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests currently go out Monday and Thursday mornings.

- -

scan-mass-west

This list covers all of Western Mass from East of Worcester
to the West.

To subscribe to this list, send a message like this:
To: scan-mass-west-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-west-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests currently go out about every two days.

- -

If you have direct WWW access, you can get on (or off) of the
lists via the simple interface at:
http://www.netspace.org/cgi-bin/lwgate/nest/

http://www.netspace.org/cgi-bin/lwgate/scan-mass-east/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-west/
or for the digested versions:
http://www.netspace.org/cgi-bin/lwgate/nest-digest/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east-digest/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-west-digest/
depending on which list you're interested in.

Hello everyone.
I Live in Minnesota, next to the Anoka Co. Airport. It is a small private type of airstrip, but in the last 3 days or so there have been MANY C-130's and other small military aircraft landing and taking off there. I have the normal freqencies for the planes to tower, but cant seem to find the tower freqencies. In all of the books I have look at it says it is 118.200 but that is never used, and I can look out my window and SEE the planes land. Any help would be appreciated.

3961. Need help from south Jersey listeners

Newsgroup: rec.radio.scanner

From: alanoue@shrsys.hslc.org
Message-ID: <22MAY96.17045674@shrsys.hslc.org>
Source record: 233301

I often pick up activity from the freq. 165.087, and was wondering if anyone knows exactly what this is. It sounds like a mix of some law enforcement, with military. Could it be MP's from Fort Monmouth, or some other military base in southern NJ? I'm located in n.e. NJ, but have heard references to so. Jersey locations, that's why I suspect it's located there.
I've also seen this freq. attributed to SS "uniform" ch. but don't believe this is the case with what I'm hearing.
Thanks,
Phil

From: marsecom@deltanet.com
Message-ID: <4nvlhd$1lm@news03.deltanet.com>
Source record: 233304

I am using the Uniden MR-8100 scanner mobile and have noticed that it seems to have a very bad
imtermod/selectivity problem. Has anyone found a way to improve it's intermod performance other than using a band pass filter (a bit impracticle in a mobile environment!!)??

Also, does anyone know a source for a windows based version of SCAN.EXE (it's programming software)???

Any information woul dbe greatly appreciated. Please send responses to me E-Mail address.

Thanks,

Chris

Easiest way - look in the telephone book for FAA Flight Service Station (probably an 800 number in another city) and call them. Ask for the VHF and UHF tower, ATIS, ground control and approach control frequencies for your airport. Also ask for any NOTAMs (NOTice to Air Men) regarding military traffic at the airport. Also, if the airport has an FBO (fixed base operator) that sells fuel, rents planes, teaches flying etc., call them and ask the same questions. If the airport is city or county owned stop by and ask to see the airport manager. Get him/her to give you the lowdown. Also, invest $20 in an hour of a flight instructor's time to have him explain aviation comms to you.

can you get 225-400? Most tower freqs have a corresponding
UHF tower freq such as minneap. center or chicago center.
Listen to the center freq for your area. There is another
225-400 freq for that channel you have to find.

You have proof that the book you published in 1989 was ever copyrighted? If not, no crime was committed. I can imagine Gene Hughes going after everyone who published a portion of his books, he'd never have time for anything else.

As for posting all the mistakes you made in your book here, why bore the subscribers to this list with that nonsense. Besides, I wouldn't want to embarrass you that badly in front of everyone.

****** As for being a liar, Jim's first frequency guide WAS PUBLISHED IN 1987, so how in the heck could he have copied your book which was published in 1989? And I can prove that, Mister Stark because I bought a copy******** Basically, you were able to force a guy to stop publishing his guide because you were afraid of the competition and he didn't have the funds to mount a legal challange.

Facts is Facts.

Have 3 Uniden UHF Handheld transceivers for sale

Model: SPU48K
a couple years old.

These are digital units. 8 channel. 5/1 watt selectable.

Originally in a retail security department. They shelved them; opting to
use the Motorola P50s they had instead. (go figure)

I have two new batteries and three originals (still charge well).
I have 3 quick chargers as well (APX-115).

Radio w/charger:

$500.00 US
(radio retails @ about $800)

Package all three:
$1300.00

I just got the BC230XLT. It is actually a BC220XLT (even identified on the unit as so) with an additional nicad battery and a nicad battery charger / AC power supply.

I think I have seen advertising for cell modifications to the 220 in mags such as Monitoring Times. I bought mine from Ace Communications at http://members.gnn.com/IDAINC/index.htm on the web. They had the best price and have a bunch in stock. They also send a "mod" which is just a piece of paper listing the different range to scan to listen to cell calls. It works since I can listen to some, if not all cell calls.

Let me know if you have any questions. The April 1996 issue of Monitoring Times has a review on the unit.

Anyone know what freqs are used by Weather Service/NOAA scientists while chasing storms? From video I've seen on some PBS programs the vehicles have as many antennas as some amateur radio operators do.

Also, how about the amateur and commercial storm chasers. Are they using CB and GMRS or other freqs?

Thanks in advance

Kerwin

Well, it looks like there ARE still a few cellular-modifiable scanners to be had at Radio Shack. I just bought one of two PRO-2026s that one of the local stores had left. The new boxed unit was a 12A5 manufacture, but the display unit had a date code of 9A2. The sales guy was really friendly, and even let me have the mounting bracket and instruction manual from the newer one, since the display's stuff was long since missing. You should have heard him talking to his manager on the phone: "Yeah, he wants the display unit. No, that's the one he wants. I don't know why he doesn't want the new one." The closeout price of $149.99 was also pretty hard to pass up.

I can tell you that the first thing I didn't do was take it home, cut L201, and then hook it up to see if it worked (it did, but then how would I know?). :)

It's not that I bought the scanner solely so I can eavesdrop on phone conversations - I already have a PRO-43 for that. I just hate being told what I can and can't listen to on the radio, and my wife's getting tired of the wiring harness for the 43 in the car, anyway. Besides, the scanner says "Realistic" and not that dorky "Radio Shack."

>local dealer wants $50 to do this, which seems a little excessive for a
>convenience that I have been able to deal with.

Sorry I can't help you with your Bandplan although from what I understand this can be done with a simple terminal programme - all you need is an RS232 interface. As you say $50 seems excessive for what I was told takes just a few minutes of "hook up" to a PC.

I have bought a couple of sets from Javiation in the UK and am now thinking of an AR8000 (have to sell some stuff first though !). The "package" they sell includes the US Automode Bandplan if you want it and Scout modification - both without any extra charge.

Good luck
Harry.

From: kamst39+@pitt.edu
Message-ID: <4nv4o1$nh8@usenet.srv.cis.pitt.edu>
Source record: 233385

I'm still rather new to the radio field, so you'll have to forgive
any questions that many of you will consider basic.

What is an ideal antenna for each band? ie, what is the relationship between
frequency and length of antenna?

Can an antenna be too long or too short?

Whenever someone talks about a 1/4 wave or 5/8 wave antenna what do they mean?
Which is better? And why?

Is there some sort of basic principle that states, antennas will be more
efficient if they are some even multiple of the wavelength?

All size considerations excluded, would the BEST possible antenna be one that
is the same length as the wave of the frequency?

Thanks in advance.
Keith

it?
>
>

Well, the specs on the diode aren't critical for this application. I believe RS sells a pack of small diodes that look virtually the same as the one you broke. I used them in my PRO-34 to try to unlock some other bands besides cellular. Just need one with a foward voltage of about 0.7V, a reverse breakdown of over 10V or so, and max current in the mA range. I think you'd be hard pressed to find a small diode that wouldn't work!

A word of warning here: putting in a diode to unlock other bands (besides cellular) will probably not work. The RF circuitry is there to tune the cell freqs, but the law requires them to be blocked. The other freq gaps are there due to RF circuitry limitations, not due to legal requirements. So, other than the cell gap, the scanner won't have the RF section tuned for that freq range. To get the other bands (ie the European version's bands) the RF section needs to be tuned differently (ie you need to trade a current band for your new one). And on some scanners (mine!) the mod unlocks the European band and locked out a US band, you could not have access to both! So my scanner accessed the new Euro band, but didn't tune in anything, and the US band I could tune, I could no longer access (Hell of a mod)! I suppose it can't hurt to perform such a mod if you don't loose a band, but I have found it pretty useless.

Gee that's real smart. Great thing to talk about on a public news group. Aw, but you've got nothing to worry about you didn't use your real name - you used Bdir, and I'm sure a provider like AOL will keep your identity secrect even if pressed by the police... Yeah right - good luck friend.

4015. Signal Tracking

Newsgroup: rec.radio.scanner
Date: 1996-05-22 00:00:00 UTC
From: kamst39+@pitt.edu
Message-ID: <4nv6ps$np7@usenet.srv.cis.pitt.edu>
Source record: 233389

I was wondering how easy it would be to track a stationary transmitter?

Let's assume we have a transmitter, transmitting frequently but not constantly at 5 watts. The transmitter is operating at say, 145.0000 mhz. The antenna used on the transmitter is a 16inch whip.

What methods could we use to track that signal? I'm interested in methods that could actually be used without $20,000 pieces of equipment and so on.

Would a highly directional antenna rotated at say 5 degrees measuring the 'power' of the signal at each rotation work? I suppose we could use the logic that the most powerful reading would mean we were pointed directly at the signal and the weakest signal would mean we were pointed directly away from the signal.

And if you suggest methods like triangilation(sp), then explain the logics and actual methods that consists of.

Thanks
Keith

They just created the dream scanner, the AOR R-7000. It has a color LCD display built into it so you don't need a PC. Already out in Japan, they showed it in Dayton and should be here by the end of the year. Supposed to be about $1500.

That's right. The signaling is done out of band now.

Only problem with this design is that without an expensive analog delay
line in the phone base, the first 50 ms or so of the data is passed to the
phone line resulting in a brief "buzzsaw" into the ear of anyone else on
an extension or on the other end of the line. A hookflash press for call
waiting from the cordless often has the same effect.

: Harry kd6nhn
: stuver@ix.netcom.com

The new SAC-8000 interface (ribbon cable to 1/8" plug) comes with a
slotted battery door cover that's pretty well an OEM match. It's on my
radio permanently now.

I don't think that AR8k ribbon cable could suck more. Evidently none of
the design team ever built one of the original Sinclair computers or
they'd have had enough of ribbon cables to last them 2 lifetimes!

Steve Kennedy (prografx@teleport.com) wrote:
: Unfortunately, the unit you got is probably old enough to have two
: related "pain-in-the-butt" design flaws.
:
: 1. The DC power cord was captive, built-in at the factory and cannot
: be removed. This might require some modification if you don't care
: for this (a coaxial 12Vdc input is much more versatile if you intend
: on moving the scanner around).
:
: 2. The scanning memory is volatile. As soon as 12Vdc is removed, you
: lose all of your programming. That is why the DC cord was made
: captive. The older unit was designed to go into the car on a
: non-switched circuit and left in place so it would retain its memories
: as long as the car battery was OK.

I very nearly bought the other unit because of this, but then I realized that that would have been besides the point. I'm thinking of inline Molex connectors (and a Molex-to-coax adaptor) for in-car and in-house power. A 9V battery snap (and battery, of course) wired to the nonswitched 12VDC and ground should provide for memory retention when needed. Sure, it's a minor pain, but it can be dealt with.

The big pain, however, is figuring out exactly where in my wife's Festiva this thing can be mounted. The under-dash console is too small for it to fit without trimming (the car's paid for, with 150K+ miles, and my wife STILL won't let me in there with a drill or a hacksaw! :). On top of the dash is out of the question. I may end up hacking a salvage-yard console to fit the scanner and throw it in there. (It'll fit in my car easy, but my car hasn't moved in over two years.)

: If you can find some 11A3 date coded units, those can still be
: modified AND they have detachable DC power cables AND they have ALMOST
: non-volitile memory. They can withstand having no power applied for
: up to two weeks or so without losing programmed memory channels.

Probably pretty darn rare at Radio Shack. Better luck would be had perusing the scanners at your local pawn shops. I don't think I've ever been in one that didn't have at least one scanner for sale. Sometimes the prices are really reasonable too, like the brand-new RS DX-380 SW receiver I picked up for $20 once (geez, I hope it wasn't hot!).

: You make a very good point...don't overlook the display model, as it
: is likely to be restorable. Just be aware that the older model is a
: little different in the DC cable/memory volitility departments.

I think it should also be noted that what you hear on your scanner is not what you hear on a shortwave radio. It has already been said that a scanner is "local", that is, not picking up signals from as far away as a shortwave reciever. On a shortwave reciever, for instance, you won't hear the police in England, for instance. Most shortwave from my experience is news or talk show oriented.

Message-ID: <31A53AB8.4FD8@ticnet.com>
Source record: 233204
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

Hello all,

I don't frequent this group much so please remit all replies to my email below.

I used to be a shortwave radio enthusiast and I have a very nice timer-recording radio for sale. Here are the features:

Shortwave Radio Recorder (Radio S. brand)
Digital Tuning/International Band/AM-FM

Tunes SW 1.711-29.999 MHz and LW 15-519 kHz Plus Local FM Stereo and AM

45 memories to store frequencies for instant recall (9 FM, 9 AM, 9 LW and 18 SW)

Built-in auto-stop cassette recorder lets you record broadcasts and play your favorite tapes

Tape standby switch records a program at a preset time

PLL circuitry for precise frequency tuning

Multifunction LCD display with night illumination

Selectable narrow/wide AM selectivity

BFO permits CW and SSB reception

Normal/CrO2 tape selector - Display light on/off

External antenna jack for shortwave and AM broadcasts

Battery backup retains stored frequencies

Stereo headphone jack for listening to FM stereo

Dual time-zone LCD quartz alarm clock with sleep timer

Wake to your favorite radio station or buzzer alarm

Cassette play/record LEDs - Tone and gain controls

Operates on batteries or vehicle DC/household AC
with optional adapters

.....

I am asking an even $100.00. This is just a personal piece of equipment
of mines and I have taken very good care of it (even got the original box
and owner's manual!)

If you are interested please email me and we can work out some kind of
payment so that neither one of us gets ripped off !

Radio Shack is quite a joke anymore. We have a store here that I go into occasionally to get soldering irons and stuff like that. Well, I noticed they had a part time job offered so I applied. Well, the guy called me and I went down there and we talked. He complained that he couldn't get anyone that knew anything about radios or electronics. He was really happy to see my Military Electronics background, he said "Finally!". So we got to talking and I asked how much they paid. $4.75/hr (Thats Minimum Wage in Oregon). Oh but I get 7% commission, in a few months he said, I could be making up to a whopping $6/hr! Oh my, why am I wasting my time in College! Rat Shack is ludicrous to expect people that have any type of background in electronics/radio to work there. Anyone that does, certainly can get more than they can offer even after a few months.

So, now they have 3 HS girls working there who are absolutely clueless. My buddy had seen a Radar Detector advertised on sale so we went down. While looking I checked out some scanners (They did have a deal on a PRO-60 for $275). Well, I was pleasantly surprised to learn that our Poliec had switched to 800MHz! After I told the girl that she was full of it, she goes on to tell me that they had indeed switched but that it was a "split" system!!! Hmmm, a VHF/800MHz system. Like someone said before "You've got questions, We've got answers.......Just not correct ones". Make sure you know what you want before you go to RatShack because the sales people certainly won't

>Also, why is CDMA being deployed in other countries but not the US?

I could be in error; as such, I'm cross-posting to alt.cellular.tech in the event that a more knowledgeable person over there might flag any errors I'm about to make.

It is my understanding that the TDMA (time-dependent ...) technology has the toehold in the U.S. Supposedly, the L.M. Ericsson company of Sweden is the leading developer of TDMA-based systems, although they also hold patents in the CDMA field. Those systems are well-established in the U.S., albeit less so elsewhere (where CDMA seems to have more appeal).

I would benefit from a technical comparison and contrast of TDMA and CDMA.

: ---

No, agreed this action should not be encouraged. I personally don't think
that playing with the drive thru clerks, etc, is equal to running over
rural mailboxes. ie, where is the permanent damage to the radio system?
or to McDonald's reputation? Naww... it would require a pretty good argument
to prove that a couple nights here and there of transmitting on their freq's
would do any actual harm.

Point I'm trying to make, Do not restrict the free flow of information
because use of that information could be used in an immoral/illegal fashion.
They publish plenty of how-to-make-atomic bomb books, books on assassination,
etc.

Information in itself is NOT, and should never be illegal. Regulate
the actions not the mind. Do not restrict the learning process. Let the personwho decides
to transmit on MCD's freqs make the decision on whether or not
he will commit a crime.

And if someone has committed a crime, and they are caught, they shoul dbbe punished.

Keith

4041. Trade stuff for Wideband scanner

Newsgroup: rec.radio.scanner
Date: 1996-05-23 00:00:00 UTC
From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <4o0oq8$u2m@coranto.ucs.mun.ca>
Source record: 233246

I am interested in trading for a wideband scanner and have some
items I am willing to trade with listed below.

- Realistic Concertmate 700 Stereo Pulse Code Modulation Keyboard.

Can be connected to a drum pad. It has the drum features built-in
(Hi-hat, Bass Drum, Snare Drum, Cymbal, etc). Interested in trading
for something. This is not a Computer keyboard but one like a BAND
would use to play music. It is a mid-size keyboard. Smaller than a
FULL size one but larger then a portable one. This is a TRUE stereo
one and not a MONO one with two speakers like some cheaper ones have.
I am the second owner but was told by the original owner he paid $400
for it.

- JVC GZ-S5 Compact Video Camera, RCA VGP170 VCR & RCA TGP1500 Tuner.

I have a JVC color camera, RCA 12 volt VHS VCR, and RCA Tuner combo.
(can also be used for slow scan TV/ATV). The JVC camera, RCA VCR and
Tuner is a package. The Color camera pluges into the 12 volt VCR.
Works fine but I think the VCR needs a cleaning. Good also for recording
christmas or birthdays, etc. Can be used just like a camcorder but
uses two parts (camera and portable VCR) instead of one. It was around
$2000 for the entire package (Camera, VCR and Tuner) in 1985 or 1986.
VCR works on 12 volts or 120 volts AC when connected to the matching
tuner. VCR is also is remote control but I don't have the remote for it.
A universal remote like radio shack sells will work on it.

- JVC GR-C1U VHS-C Camcorder.

Also have a JVC Camcorder model GR-C1U that also comes with charger,
new 9.6 volt 1400 mAh ni-cad battery, RF-unit (to connect camcorder
to TV), and Hardshell carring case. Cost about $1500 new. Hardshell
case was an extra option. I just bought a NEW battery around christmas
time. The JVC camcorder is a mid-size one. Smaller then a full size
VHS camcorder but bigger then a palmsize VHS-C camcorder. This camcorder
is a VHS-C format.

4042. Re: NE1 get in trouble for scaning??

Newsgroup: rec.radio.scanner
Date: 1996-05-23 00:00:00 UTC
From: n9jig@TheRamp.net
Message-ID: <n9jig-2305960036000001@206.68.164.20>
Source record: 233247

While I absolutly agree that scanning is a harmless diversion, and I have made signifigant investments of time and money writing about scanning, the biggest issue here is property rights. If Universal, or other privately owned place wants to ban scanners from the paying customers, they should post an inclusive warning in a conspicuous spot. If they want to ban something like this (or photographic equipment etc) then they have the right to. They may well lose my business and that of other radio hobbyists, but that is their problem.

The other issue is how they go about enforcing these rules, posted or not. There is no reason to harrass someone for lawful activity that he was not aware violated any rules. Too often security guards and police mistakenly beleive that scanners are unlawful. As a police officer myself, I was considered weird for playing with radios on and off duty. Now they are happy I do, since I handle all the technical details of our radio system, and save my department a lot of money....

the BC230XLT comes with an extra battery. They even say "BC220XLT" on the radio itself, just that it is packeaged differently.

AFAIK, they are not directly cell modifiable, but will hear cell calls on image freqs.

I have the same problem with mine every time my dear son leaves it
somewhere turned on. I think if you check your manual button it will
be working. Each time you press it you'll go up a channel. If you
look at the display while doing this you will notice that the reason
it wouldn't scan is that EVERY frequency has been locked out. All I
do is use the manual button to bump it back up through the channels
hitting the lockout button on each to release it. I've probably had

it happen 20 times.

Hey Jason,

You might want to take a peek at the latest version of the D.O.C. laws up here in frosty Canada.

Here's a D.O.C. excert published in the Manitoba edition of the 1995 Scanner Book:

WARNING FROM D.O.C.

The department of communications would like to make itself clear on the laws of scanners.

As of this date(1995) scanners are:

1) Legal in Canada.
2) Illegal in motor vehicles.
3) Cellular phone monitoring is legal in Canada.

In the future scanners will be:

1) Illegal in canada.
2) Get you time in jail.

Not only will the government of Canada want to ban the monitoring of cellular phones. They also want to ban scanners all together. This is no joke this came from the mouth of a DOC official.
The time table for this will be 1994. That is why Radio Shack is moving to scanners that cannot be easily modified for cellular reception.
As far as scanners in motor vehicles goes, here is the law.

H.T.A. L.N. 1985-86, c3-chap h60 page249

Certain radio receiving sets prohibited.

214(1) Subject to subsection (2), no person shall equip a motor vehicle with, or operate a motor vehicle equipped with, a radio receiving apparatus, capable of receiving police transmisions, within the radio frequency band, 150 to 174 or 413 to 470 megacycles.

Exception.

214(2) Subsection (1) does not apply to persons lawfully authorized, under the Radio Act (Canada), to equip vehicles two-way radios, or to peace officers, or to employees of a municipality or of the Government of Manitoba, acting in the capacity.

I don't have a copy of the Radio Act of Canada my self, but I was told by someone that there is a law which applies to modifying scanners. It's also a screwy law which doesn't prohibit you from modifying it but you can't use once it has been modified. Kinda like the radar detector law here in Manitoba. It's not illegal to own one, you just can't use it in a vehicle... :) Oh well.....

Thomas J. Kravitz (mpage@netcom.com) wrote:
: What you don't have a complete grasp on is that the public service
: agencies want the media to cover their people doing what they do best and
: most agencies have no objections to the media monitoring. All agencies
: exist on taxpayers' money and the best way for taxpayers to see what
: their agency is doing for them is to get media coverage.

You have a reasonable argument, but it doesn't seem quite to the issue.
I'm well aware that most local agencies welcome _favorable_ exposure of
their activities. The question is whether the ECPA applies to the media
in regards to the provision against 'scanning for profit'. Can a local
agency override this act by inviting an organization to scan their
freqs?

I'm absolutely sure these 'pager notification networks' are far
afoul of both the letter and intent of the ECPA and are a danger to those
of us who scan as a hobby by commercial exploitation of monitoring.

: They also want buffs (especially fire buffs) to be able to cover their
: incidents because the buffs supply them with photos that help both in the
: mediam newsletters and especially in training situations.

In my experience, yes, the FD does welcome a media presence at fires. You
seem to imply that they would welcome amateur photographers showing up at
fire scenes and further clogging their fire lanes, and I'm sure this isn't
the case.

: There was also a recent case in Tulsa Oklahoma where a person was
: convicted of both using bootleg Motorola programming software and
: monitoring the Tulsa Oklahoma PD frequencies. The person sold trunkking
: radios to the new media. The appelate court overturned the ruling, siting
: that the airwaves belonged to the public and if it could be monitored,
: the public had the right to do so. He was still held accountable for the
: copyright violation.

Not sure that the above applies to the subject at hand.

: I am not sure what time you spend with either the media or the public
: service agencies, but I do that for a living and while some agencies are
: being sold a bill-of-goods from particular sellers of equipment, most
: have no objection to the media or buffs monitoring or knowing what they
: are doing!

I agree - as long as the media coverage is favorable and 'ambulance chasers'
don't start showing up at wrecks, crime scenes and fire. How long do you
think they'll maintain that attitude if they get overwhelmed by curiosity
seekers? Or if the media coverage turns critical?

Hello All,
A resistor in the positive wire to the cassette-recorder`s dc motor can
double the recording time,you can also make the speed variable by
using variable resistor/potentiometer.
Greetings...

A resistor in series with the motor may work, but not reliably. It would drop too much voltage for the motor to start up if you are using a carrier detect relay.

Actually, every tape recorder that I've purchased lately has had an electronic controller on the motor anyways - with a trimpot for speed adjustment!! Adjust the speed as low as possible for the motor to start and stop reliably, then take the pulley off the motor and turn its diameter down on a lathe. Use some 120 min audio tapes and you're set.

I must apologize...

For some reason, this file did not attach itself to my original
message. I went on vacation and later discovered the situation.

This is the most complete list I know of for US Customs. If you have
corrections or additions that you know are good, please pass them
along or edit this file and kindly send a copy to me.

Enjoy!
Uncle T.

>and the weakest signal would mean we were pointed directly away from the signal.

A parabolic antenna would give the highest directionality for doing things like this.

With a big enough dish, you would have almost no signal unless pointing directly at the transmitter, which would nake finding it intially a bit tricky. You would probably need a scanner with an omni-directional antenna as well - listen for the signal on the scanner, and then twiddle the dish to find it.

If the transmitter you are trying to find is putting out something audible, (even if it's just a whistle) you could probably just listen for the loudest noise with a scanner, but a spectrum analyser will make it more accurate.

>And if you suggest methods like triangilation(sp), then explain the logics
>and actual methods that consists of.

Triangulation would work. This is easier with 3 or more listening stations, but it's doable with one person.

With more than one tracker, each tracker takes a bearing to the transmitter. These bearings are transmitted back to one post. At that post, a line is drawn on a map from each listening point in the direction of the reported bearing. The point at which those lines cross is the location of the transmitter.

With only one person it's a bit more difficult, as the tracking point will have to move to get the (at least) 3 bearings. The best way would be to take a bearing and then move off at 90 degrees to that bearing to reach the next tracking point. Once you have done this to get your 3 bearings, plot the bearings on a map to locate the transmitter.

And even though there is a up-banded GSM system (DCS-1800) in several
countries around the world, the frequencies are different from the US
PCS system, which around 1900 MHz IMHO.

And of course no lines or plugs - GSM systems are cellular systems.

From the storm chasers homepage; I dont think these programs are in
operation any more. The only chasers out there are those that chase
because they want to! And Skywarn (Canwarn in Canada) spotters/chasers
who use VHF ham radio. Try the VHF ham band (145.1-145.5 and 146.5-147.4)
and listen for skywarn nets. You can also check the storm chasers
homepage..I think he lists some repeaters that skywarn uses by area.

Here are some NASA and Shuttle freq. :

Space Shuttle - 259.7000 & 296.8000
NASAS - 231.0000, 240.4000, 240.8000, 241.2000, 241.6000, 241.8000, 242.0000
256.2000

I can't pick this range up on my scanner so I don't no if they work...
I have a PRO-46, if anybody knows how to modify it please let me know.....

Later...

I thought that current day payphones did away with that!

I heard that several years ago, people built these tone generators, and the phone companies finally came out with payphones that operated differently.

Sure, I'll explain. I'm an annual passholder who goes to the park
every couple of weeks. I carry a scanner because I'm curious as to
the workings of the park. Also, it's downright entertaining. I
imagine that if you only go once or twice a year, scanning would seem
strange. But it gives me just that much more information about the
park, which interests me.

Yeah and one more Radio Shack bash....

This saleman tells me we found this scanner in the back (a 2026)! He sayes "Alls ya do is clip a diode and complete coverage!", "It's gonna go quick, so let me know if you want it".

So I don't buy it yet, instead I go home to get on the internet and check what date it had to be manufactired before. Call R.S. back ask him to read me the date code. "What's that?". I say the little white sticker on the back. He sayes "Oh, o.k. it's 4A4, what's that mean?". So I explain R.S.'s date code system to the R.S. rep. "Wow I never knew those were even there" he sayes.

Come on don't they train their reps?

Do these guys work on commision?

P.S. it's STILL there sittin' on display 3 months later. Boy that went quick like he said.

The 230XLT actually refers to a "Package deal". If you by the 230XLT you get a 220XLT scanner (it still says 220 right on the front) and an extra battery and charging "tray". SO the difference between the 220 and 230 is just the extra battery and charger you get with the 230.

The 220 is only modifiable by doing the virtual downconverter mod (not a trivial task). I have not seen plans for the mod but they were supposed to have been published in a JAN. edition of RCMA Newsletter. I think the Cellular Security Group can do the mod if you send them your scanner.

4081. AR8K/SCOUT interface synopsis

Newsgroup: rec.radio.scanner
Date: 1996-05-23 00:00:00 UTC
From: stuver@ix.netcom.com
Message-ID: <4o2fmm$ha3@sjx-ixn3.ix.netcom.com>
Source record: 233286

AR8000/SCOUT & INTERFACE USERS,

I have now been using the AR8000/Scout & ScanStar software for a year.
The following is a synopsis of my experience.

The 8K is a well designed scanner except for one major flaw. The flat
cable interface jack. To use this jack is a nightmare. First you must
remove
the protective case, then remove the battery cover. After that you must
deal with the flat cable. The cable that is used on the interface is 6
inches and rigid,(and yes girls size does count here). To get around
this prob
lem Optoelectronics uses a 1/8" phone jack on thier Scout and expect
you to install the same on your 8K.(very easy mod that they supply
instructions).
I now see they came up with a flat jack to 1/8" plug cable. So now you
don't
need to do a mod. This is a two wire one way data transmit from Scout
to 8K.
But what about the computer interface, your still dealing with the flat
cable. And in both cases the covers must come off. Or you can cut a
hole in the battery cover and case.
After owning my scanner for a month I could not be satisfied with flat
cable
interface. Nor would I be pleased with the 1/8" jack idea.
My solution was to install a better interface jack.
This mod is NOT for the faint hearted !!!
It involves cutting a hole in the top right side of the 8K and
installing a
6 pin modular quick connect phone jack.(I know the flat cable is 7 pins
but 2 are ground). Also on the computer interface(I used the EDCO) get
rid of the flat cable and solder on a standard 6 conductor modular
cable(6 fee
t works for me)and crimp on a 6 pin plug. For the Scout cable I used 2
conductor modular cable with a 6 pin plug and a 1/8" plug.
This works superior. The battery case can be left on and the protective case
left on you need only to undo the velcro at the top about a inch insert the 6
pin plug then push the velcro back over the jack.
I can provide the details if intrested.

As far as the 8K goes the band plan has a few mistakes that can be corrected.
The unit also has a few "bugs". Twice now I've had to remove the batteries to
turn off the unit. Hmmm
The cellular can be opened with software.(although this is against the law).
*Advice needed... my rubber knobs on top of the radio are spinning on the

switches, what type of glue should I use to keep them in place, I still would like to be able to remove them.* Thanks in advance.

The Scout is a great tool for scanning.
Depending on the frequency,RF power output,and noise level the range of the varies from 10 miles from a broadcast FM station to 2 feet from a cellular phone near a cell site. False reading are nil. 400 memories and 200 hi
ts are very useful as is the sleep mode.

Put the 8k & Scout together and they work great.
When the Scout detects a "hit" it beeps twice and reaction tunes the 8K.
If you don't want to here that hit again or if you want to scan just press the LOCAL then SCAN,SCAN. If that freq. comes up again the Scout beeps once and does NOT reaction tune the 8K. Fustration occurs when near a strong station and the Scout hits on the station but, off by a few KCs. It will tune the 8K to these freqs. Also the Scout loves to hit on digital transmiss
ion such as pageing and MDT's .I plan to put a inline switch on the cable to quickly disable the reaction tuning.
The antenna used on the Scout is the key. Most scanner antennas work very poorly. Try to match the antenna to the desired freq. I use the RD800 antenna and it works good for vhf,uhf and works great on 800 mhz.
Typical distance for reaction tuning for cellular calls from a car is 20 feet or in another words you must be next to the vehicle. Once again this is against the law and should NEVER be done.

There are many times when I have left my Scout home and only had my 8K but, they are a team and work great together." Don't leave home without THEM "

: >
: >

: I thought that current day payphones did away with that!

: I heard that several years ago, people built these tone generators, and
: the phone companies finally came out with payphones that operated
: differently.

No, actually, they are still using the exact same tones they used years ago.

The system that recognizes these tones is called ACTS. ACTS stands for
Automated Coin Telephone Service. It's a computer whose sole purpose is
to collect money. Initially, your call must be either non-local or long
distance for ACTS to come on, unless your call is placed through directory
assistance. Basically, the initial charge must be more than $.25.

The two frequencies you need to combine are 1700 and 2200hz. They must
be 30msec in length, with a 33msec pause in between them. One tone equals
a nickel, two equal a dime, 5 equal a quarter.(ie each tone is worth 5 cents)

Yes, radio shack's 43-141 dialer CAN be modified to create these tones. HoweverI don't
think they produce the dialer any more. You need to replace the
only crystal that is in the dialer with a 6.49mhz crystal. Not sure if 6.49mhz
is available, use the closest(6.5536 is common) one you can find.

Also, ACTS is ONLY implemented in payfone systems that use TRUE BELL WESTERN
ELECTRIC PAYFONES. If there is a bell symbol on it ACTS is present. ANY other
payfone, such as those made by third parties, or offer different rates or
charges, is a COCOT(Customer Owned Coin Operated Telephone). A Cocot handles
the charge of the call LOCALLY and not through any of BELL'S standard
charge procedures.

ACTS is fairly tolerant as far as Frequency, loudness, tone length, and
tone spacing. Don't be afraid to stray a little outside of these specs.

Be forewarned, that manufacturing, possesing, and using ANY telecommunications
fraud device is ILLEGAL and is punishable by STRICT FELONY CHARGES!

>$150 can it be modified for anythign?

Look at the small white sticker on one of the end flaps of the box (and it should match the same date code sticker on the rear panel of the Pro-2026).

The date code is broken up into digit(s)-Alpha-digit format. The first digit(s) before the letter are the month of manufacture. The letter isn't important as far as anyone knows, and is used as a separator. The digit after the letter is the year.

So, if the date code sticker says 11A3, it was manufactured November 1993, and has the L201 jumper which means that certain 800Mhz frequencies that were blocked can be restored.

If the date code indicates manufacture at or after April 1994 (4A4 and later) it cannot be restored.

Since Radio Shack put the Pro-2026 on perpetual sale at $149 (after Christmas 1995), I have seen many 11A3 coded units in stock along with the 7A4 un-restorable units. You just have to look, and not all stores in all states have them.

Unfortunately, the unit you got is probably old enough to have two
related "pain-in-the-butt" design flaws.

1. The DC power cord was captive, built-in at the factory and cannot
be removed. This might require some modification if you don't care
for this (a coaxial 12Vdc input is much more versatile if you intend
on moving the scanner around).

2. The scanning memory is volatile. As soon as 12Vdc is removed, you
lose all of your programming. That is why the DC cord was made
captive. The older unit was designed to go into the car on a
non-switched circuit and left in place so it would retain its memories
as long as the car battery was OK.

If you can find some 11A3 date coded units, those can still be
modified AND they have detachable DC power cables AND they have ALMOST
non-volitile memory. They can withstand having no power applied for

up to two weeks or so without losing programmed memory channels.

You make a very good point...don't overlook the display model, as it is likely to be restorable. Just be aware that the older model is a little different in the DC cable/memory volitility departments.

PRO-23 Cellular Fix (Keypad)

Warning this will reset all memory to factory!

1. With the radio switched off, hold down the 2, 9, and LOCKOUT keys; then turn the scanner on and release the keys

2. Manual step to Channel 15, this will show 888.960 MHz a factory test frequency.

3. Press either the up or down search arrow to search in 30 KHz spacing. You may store up to 10 frequencies un the MONITOR bank.

4. You may then step to the MONITOR channel you want then press PROGRAM to put it in a any of the regular 50 channels.

> with the radio. But to be fair what type of antenna works from 100Khz to
> 2Ghz? I'm wondering if anyone has restored cellular on this or the Canmis

No need on the CAMNIS HSC-050 and TR-2400 and other clones sold outside the
US are "full coverage".

> HSC-050. From what I gather from the reset programming it seems that one
> would be able to enable 824 and 869 from the keypad. There seems to be

> same as each other (see below).
>
> 4 ENT 195 ENT 512 ENT 749.275 UP DOWN
> 5 ENT 512 ENT 1013 ENT 287.525 UP UP
> 6 ENT 1013 ENT 1570 ENT 287.525 DOWN UP
> 7 ENT 1570 ENT 2060 ENT 749.275 DOWN DOWN

Nearly but not quite. This is taken from our Web site (originally somewhere
down the line I assume. There is also a .txt file in the Compuserve Hamnet
Library.).

If you could "see" the plan on your TR-2400 you would fund you had more than
"seven bands"...something like....

5 ENT 512 ENT 871.00
6 ENT 896 ENT 1013

In other words 871-896 would be missing. I'm not sure if there is a limit
to the number of "bands" that can be entered.

Refer to the reset instructions on our Web site and you will restore full
coverage to the TR-2400 you have. The third column of digits relate to the IF's
used these frequencies. The table you originaly quoted gives full coverage
together with a bit more and some internal switch pressing also.

> believe they restrict cellular. Could I just substitute 749.275 at this point

Nope.

Several PCS standards have been proposed. These are the PCS version of D-AMPS (which supports PCS service in both the 800MHz and 1900MHz frequency bands), PCS 1900 (essentially the European-developed GSM/DCS 1800 standard, working at different radio frequencies and supporting ANSI signalling standards), and CDMA (also known as IS-95). Last summer the future for IS-95 suddenly began to look very bright, despite many industry insiders anticipating the others might win over.

IS-95 is a digital cellular standard endorsed by the US Telecommunications Industry Association / Electronic Industries Association (TIA/EIA) based on CDMA technology. Each channel will occupy a 1.25 MHz segment (forward or reverse). The carriers are divided into a maximum of 62 information channels using orthogonal codes sequences, Walsh Codes. These spreading codes are added to the information signal to produce a wideband waveform. The speech is governed by a variable bit rate codec (0.8 - 8 kbps). New codecs will operate at 13 kbps. In June 1993 the FCC established radio frequency spectrum in the 1850 to 2200 MHz range to provide PCS.

CDMA technology is currently under test in several major US cities.

Check out http://www.cyberpeak.com/PCS/PCS_net.htm for a PCS overview.

> Vance Socci N6FXE vsocci@best.com

Hi Vance, what a project! Is it worth the change? I wish I could offer some help but I have a different question for you. I have an AOR2515 which is a ACE modified AR2002. It looks identical to the 3000/3000A but coverage is 5 mhz to 1500 mhz, am,fm and wfm.

Would a 3000/3000A MB fit the 2515? What advantages would I gain if any? I really need more in the RF section and my RS-232 don't communicate with the computer. It's got 2016 memories in 63 banks of 32 channels and 16 banks of 2 channels. I may just send it to ACE and get it aligned.

Good Luck...

Nick

>
>>What methods could we use to track that signal? I'm interested in methods
>>that could actually be used without $20,000 pieces of equipment and so on.

Look in QST, they had a great article on building one, it consisted of a reciever, 2 antannas, and a box (with you have to construct according to their instructions). This box just sampled the signal from both antannas, and based on the difference in signal, could pretty accurately point you in the direction of the transmitter. If you want, e-mail me, and I'll find the specific issue/article.

: probably be using an earphone anyway). It's a fairly big box to hang
: on your belt. The Hamvention price was $850 if you ordered at that time.

Well, the built in speaker only negates the need to carry a separate
scanner if you're willing to forego monitoring the party that isn't
in your near-field - isn't this correct?

Can it still reaction tune an external radio ala the Scout?

All the areas you'll be visiting will have OPP on the VHF-high system
(14x.xxx). Don't think they are using 42 MHz anywhere anymore. From
my lists, the Tobermory to Manitoulin Island ferries use 157.445 in
addition to regular marine VHF. Can't confirm though, as I live much
further south :-)

I wish it was that simple. I know about that problem. Happens far too often.
When I try hitting manual or lockout I get nothing. If I hit light I get
nothing. Once started it does nothing. It allows me to use those buttons to
clear memory though through the powerup reset.

4127. A different BC200XLT Lockup Problem

Newsgroup: rec.radio.scanner
Date: 1996-05-24 00:00:00 UTC
From: jonesdj@gnn.com
Message-ID: <4o5usq$hjj@news-e2b.gnn.com>
Source record: 233178

My brother's BC200XLT battery ran down, he recharged it and then went to use the scanner. The keys all appear to work, e.g. manual, scan, WX. The SQUELCH however does not seem to have ANY effect in any position, the rcvr is never unmuted. Furthermore on search for the local NWS (~8miles) the rcvr never found when I used one touch WX, regardless of the squelch position. When the unit work properly, the squelch could be in any position and the unit would rcv NWS.

Switching battery packs did not assist.

Any ideas??? And if not, is anyone interested in a super clean BC200XLT with all original accessories and box for parts???

PLEASE respond to either jonesdj@battelle.org and/or ab045@yfn.ysu.edu (first is my e-mail, second will get to my brother).

Thank You

Dave Jones

When my 2026 experiences this memory loss, I depress the
WX/Aircraft/etc. button then either the up or down arrow (can't remember
which one restores the scanning range). No need to send to factory. Sure
is a pain when this happens because all 100 frequencies disappear also
and must be reprogrammed. Hope this helps.

As a rule, no currently marketed scanners are easily modified for
tuning to the cell bands. This is by law.
There are some scanners that *can* be modified for that, though, as the
mod isn't easy. You might get in touch with Grove to see which ones
they can currently modify, and go from there.

MNI>The eqivalent DS8000 (non AOR) has a tone for each letter.

MNI>Ken

Even if it exists, I'm not sure it would be better to have 16 tones. I
find close is good enough on frequency inversion. It's like being off
a little on side band. You can still understand everything.

Now what I would like is a DS8000 plug in that does both frequency
inversion and split band inversion. Hopefully, it would have a
decent high pass filter on the front end to keep the "sub-audible"
PL from going in-band after inversion.

4147. Scanware FCC Database

Newsgroup: rec.radio.scanner
Date: 1996-05-24 00:00:00 UTC
From: Flint@Orbiter.Com
Message-ID: <83292024292011@BBS.Orbiter.Com>
Source record: 233226

I just read an article in U.S. Scanner News about a program called FCC database. This program is a must for all the hobbiest who do not own a CD-ROM drive (like me). You may order just the data for your area, Either state, county, or even city. So you don't have all the freqs for California if you live in Flordia.
The man on the phone told me it would be about $45 dollars for data on the state I'm in and $30 for just my county.
The program itself is very extensive with the ability to create custom reports and index the database as you like. The infomation covered by the database includes: Frequency
Call Sign
Licensee Name
Licensee City
Licensee State
Zip Code
Service Code
Class
Transmitter City
Transmitter State
Transmitter County
Transmitter Latitude
Transmitter Longitude
Transmitter Elevation
Transmitter Height
Transmitter HAAT
Transmitter EFF
Antenna Height
Radius
Polarization
ERP Out
Power Out
Emissions
Number of Vehicles
Number of Portables
Number of Aircraft
Number of Marine
Number of Pagers
High Frequency Limit
PL Tone
& Notes
The article also states you may edit all the above infomation. The only two problems the writer found was:
1. When using the search funtion you have to enter
the frequency with leading zero(s)

EXAMPLE---- 000155.505
2. To print all the Infomation, you need a
wide-carriage printer.
Those things beside, this was exactly the kind of program I was looking for. I already ordered it, The man also told me that it would take a little longer to get it out because he has just recieved updated data for the first quarter of the year.
The only thing I didn't ask was if there are free updates of if there is a charge for them.

All in all, I was impressed.
Flint
Flint@Orbiter.com

I have nothing to do with either ScanWare or U.S. Scanner News. I'm just pointing out an excellent program.

is
> something like CB (hand-held) that really works well.
>

HI..sorry I cant comment on the power levels however, in both canada and
the US they have set aside specific low power frequencies for use by
security guards; warehouses; large stores such as home depot, etc. Then
several stores such as Radio Shack started offering cheap simplex low
power ht's and many folks wanted to buy them just for personal use (eg
fishing; hiking; at the cottage; etc) rather than business. So they
coined the term GMRS or general mobile radio service. Basically, its a
set of low power simplex frequencies where anyone can use a pair (or
more) of cheap hand helds. Generally, I think they are in the UHF band
(although Canada does have many low power industrial or low power unit
frequencies ... called LPI or LPU... in the VHF band as well). Difference
seems to be that CB is used for talking to others (strangers on the road,
etc) while GMRS is basically for your own personal or business use
talking to members of your own group. You still need a licence for GMRS
but its a simple form; its not like the complex submission you have to
put in if you wanted to set up your own two way radio system.

Hope that helps!

Flint,

I believe Amateur Electronic Supply sells them for $139.00. Six
bux is six bux, ya know? I'd also try calling Opto Direct, as they sometimes
offer specials and the like

Keith

P.S. From what I've heard, the CUB is about 100% more sensitive than the
RS freq counter. I have the RS freq counter and I think its garbage.

Wrong, wrong. All Regional Bell operating Companies are using IN BAND SIGNALLING for the charge tones. These include the coin-drop tones, coin-return tones, and other operater tones. The payfones communicate IN BAND to the central offices.

However, the CALL PROGRESS SIGNALLING is done out of band now. A trunk associated with the actual call is a 4800-baud carrier that contains information pertaining to the call. Information like, does the phone ring busy? Did the recipient answer? etc etc is communicated from the terminating office back to your local central office via this trunk.

If you drop a quarter in a true Bell Western Electric Phone hooked up to local Bell's equipment, YOU WILL HEAR AN INBAND pulsing of 5 tones to ACTS via the local central office.

There is an ACTS test number that exists in most areas. 959-1230 rings a coin-test. Take your tone generator and play the tones into the Mic. It will register.

|This is the same as the BC3000XLT but not blocked. Can I legally order this?
|Will it be confiscated by customs?

You can order it and at present it won't be confiscated at customs.

| Will I get in trouble with the Fed'ral Gub'mint?

Probably not; about the closest thing I've seen to that was some months back where U.S. Customs went after so-called "Spy Shops" that were importing wireless microphones disguised as plants and stuff like that. The Federales were actually whining about how the stuff the ordinary U.S. Citizen on the street was just as good as that the Gub'mint. Note that this is exactly the same sounding whine the Federales use when attacking military-style semi-auto rifles... ["These guns are made only for murdering people!" Guess that's why the Federales use them when attacking U.S. citizens and don't want you to have one...]

|Javiation has a good price on it.

Actually, it is quite a bit more expensive bottom line when you factor in shipping and duty; you're talking around $525 U.S. Compare that to around $375 bottom line for a U.S. cell blocked BC-9000 to the door. Bob Parnass has published his version of the "Virtual Convertor" that restores the cellular coverage (but not the correct frequency readout) in the latest Monitoring Times. This is a switch that cuts in the proper front-end filters for 800Mhz. He states you should get the BC-9000 service manual to do this properly...

Anyone needs a brand new Uniden BP200 for $20 drop me an e-mail! I
don't know what models it fits (if any) other than the piece o' crap
BC200XLT.
I thought the battery was shot so I bought a new one only to find the
battery wasn't the problem! Now I scan back and read messages that
other BC200XLT owners experience the same problem (NO sound, scans
fine but never finds anything like in WX mode).

Just as an aside form a user of Daves' book, while I have discovered one or two obscure little omissions/uncertainties (the Livingston County Fire freq. 2 and 3 , 46.22 & 46.20, which were mentioned as possibly being active in the book I got around 1991? or so), for the most part the book has a lot of good information in it. I might have done things a bit differently with regards to the way things are listed, such as adding or changing the categories to a county by county basis (people tend to want to know what is going on in their own area), as it is a bit difficult to sort through the different categories to find all of the freqs' that you want. While this would entail the repitition of many "blanket type freq. listings such as the NYSP or EMS and hospital sites, it would make the book a bit more user friendly for the beginner if he/she could flip to the Wyoming County page and have all of the PD, Fire, EMS, and other gov't and business listings in one spot. As a somewhat knowledgeable scanner user and ham, I can see where the average Joe who wants to hear what is going on when the siren blows could really be intimidated at the sheer volume of stuff to look through.
One thing which is a really nice touch is the inclusion of many of the unit numbers for the various agencies in the area, so that Mom can figure out what the obscure designations for the Coroner and which car Sheriff York is in.
Again, these comments are based on a copy which is several years old, and these thoughts may very well have been implemented by now.
A point that I would like to make is that I got my copy directly from Dave, when I purchased a used scanner from him that he had advertised on a local Swap Net. I did not know him at the time, and I do not know him now, but the gentleman welcomed me into his home, took time to explain how the scanner functioned, gave me the cooks tour of the monitoring station from which he finds much of his information which was quite a setup, with a lot of search capabilities. I am still using the book, although it is getting pretty dog-eared by now, and I have gotten my moneys' worth out of it. Therfore I have a lot of respect for the man and the book. This thread really has no place here as it is not pertinent to the use of scanners, and the antagonist has presented no valid arguements other than the fact that someone who is obviously a personal friend, if not himself, feels that there is a great injustice going on. Frequencies are public domain, printed matter prepared by an individual are not, and somewhere there must have been sufficient basis to Mr. Starks case if some regulatory body forced the other party to desist operations. Furthermore, any type of comments should be kept above name calling all the way around.

Just my humble opinion.

Boy am I happy!
I went yard saling today and found a Pro-2006 in great condition.
Plugged it up and it worked great too. The man was asking $150 dollars
but gave it to me for $125, What a deal. Considering everyone on the net
is asking at least $275 or up.

Now I have a few questions. The back-Light dosen't seem to work. Now
this dosen't bother me but I would like it. Is there anything I can do?
and my other question is... If I cut D502, would this inprove the
2006? :)

A happy man,

Flint

Those two channels have "solidified" into regular usage since
then. 46.22 is F-2 (statewide fireground) and 46.20 is Livingston's
F-3 (another fireground channel). In fact, the County recently renewed
their KED-602 licenses on all 4 of their channels (46.16 and 45.88 are
the other two), so they should remain in regular use for a while.

Excellent feedback. Actually, the next edition of my book (which
is in R&D now) will be arranged geographically. Even I have trouble finding
things in the 1994 edition. :-)

> entail the repitition of many "blanket type freq. listings such as the
> NYSP or EMS and hospital sites, it would make the book a bit more user

Statewide freqs will be in a statewide section so as to avoid
the need for printing them over and over. The exception would be any
statewide channel that is assigned a numerical channel designator by any
local agency. For example, 46.22 MHz as mentioned above is a statewide
mutual aid mobile frequency. Many fire departments have allocated that
frequency as their own "Channel 2", so it would be listed as such with
the rest of their local channels.

> One thing which is a really nice touch is the inclusion of many of the
> unit numbers for the various agencies in the area,

That feature is in a constant state of improvement, too. I'm
always looking for corrections and updates.

While you didn't mention the topic of radio codes, I'm still trying
to decide what to do about them. I published no codes in SMUNY for a
variety of reasons. A major reason was that most commonly used radio
codes can be easily figured out in context. Another was that my old
computer "ate" most of my code lists that I had developed over years of
monitoring while traveling around the state. There may or may not be

radio codes listed in the next book.

> gotten my moneys' worth out of it. Therfore I have a lot of respect

When this happened to my 2026, I was able to reset the unit by discharging a "battery backup" capacitor on the radio's motherboard.

Here's what I did: !Be sure to disconnect the power first! Remove the chassis top and bottom. Locate a quarter sized capacitor. Discharge its stored charge. Reassemble the radio. Turn the radio on ad it worked.

Because of the effort involved, I'd call this a resort.

Good Luck,
--Scott

4180. Touble w/ Bearcat scanner

Newsgroup: rec.radio.scanner
Date: 1996-05-25 00:00:00 UTC
From: Nick West <nick@multipro.com>
Message-ID: <4o7qct$b7e@news.multipro.com>
Source record: 233109

I own a bearcat scanner model no. BC220xlt. None of the cotrol buttons want to work. The only response I get is a beep when I press the light button. There is a skeleton-key icon in the bottom right hand corner of the screen. I think it might be a result of me accidently using the wrong adapter. If so, how much would it cost to be repaired. Or are there any other things that might be wrong?

Nick

> 500KHz-1300 MHz (as in a AOR AR2700)

500khz - 1300 MHz (1.3 Ghz) covers the shortwave as well as VHF and UHF spectrum. On the AR2700, you will be able to hear just about all that is out there to hear.......just not all on the same antenna.

> 25 MHz-1.3 GHz (as in a BC3000XLT)
>
25MHz-1.3GHZ (1300 Mhz) covers the upper end of HF, VHF and UHF. This receiver would cover your typical scanner freqs.

The question you need to ask yourself is; what do you want to listen to? If you want to monitor U.S. Naval forces enroute to the Persian Gulf, then you need a receiver that covers all of the HF spectrum, like the AR2700 (and an external antenna, forget the small aerial on the antenna). If you just want to monitor the local police/fire departments, plus aircraft flying in your area, then the BC3000XLT could be a choice.

Yes and yes. The Xplorer is a pretty big box relative to the Scout. Some
people might not want to carry their scanners with them.

Javiation has received their first batch of the World's smallest scanner, the WS-1000E (also known as the Standard AX-400). It is uncut from 500kHz thru 1.3GHz and is just a hair taller than the Standard C508A. Like the C508A, it runs on 2AAs (for about 20 hours continuously on alkalines). The WS/AX-400 has 400 channels, as well as 10 Search banks. Scan/Search speed is 25cps.

>limited to 1 watt - then I heard 5 watts. What I'm really looking for is
>something like CB (hand-held) that really works well.
>
On the main frequencies GMRS is limited to 50 watts. 25 - 40 watt GMRS radios run in the $350 - $700 prices range. There are repeaters in GMRS and depending on the area, you might be able to subscribe to one. That could get pretty good range between units. Even simplex with 40 watts wouldn't do too bad. Base stations are not encouraged and are limited to 5 watts effective radiated power (ERP). A GMRS license is usually issued for one or two of these main frequencies. It's up to you which ones you apply for.

Then there's the splinter frequencies in GMRS. A license allows you to operate on any of these frequencies but the power must be less than 5 watts effective radiated power (ERP). I use a couple of one watt units and they do real good for the power and antenna size, much better than a 27 MHz CB unit would do with that power.

Radio Shack's family band opens up in June. The FCC decided to let Radio Shack have its way and is allowing unlicensed operation on the 7 GMRS splinter frequencies plus 7 more frequencies +5 MHz of each splinter frequency. There is no real restrictions on content of communications or on-air time. Each unit will be under .5 watt and will have to adhere to strict modulation, frequency stability and antenna requirements. The units will be small and the price is expected to be in the $100 - $150 range. Range will be less than .5 mile but communication quality is claimed to be good.

Message-ID: <4o82i0$cie@dfw-ixnews3.ix.netcom.com>
Source record: 233122

Entered a freq., hit limit, got error. Now the search function is stuck, i.e., search doesn't work. I can not override the error, or enter any freqs. Normal scanning on all programmed channels is ok as is mannual, squelch and volume. I did the 2-9-manual turnon to clear all channels (which it did) but search still gives an error indication. Reprogrammed my normal 50 channels ok and scans ok. Any suggestions??? Is my only hope the radio repair shop?? If so, does Uniden have a repair service? Any guesses on what a repair might cost???

Thanks in advance,
Bob...

> or
> 25 MHz-1.3 GHz (as in a BC3000XLT)
>

First off 1300 MHz _is_ 1.3 GHz, they are the same at the high end of the dial.

The AOR has the widest range of frequencies...

500 KHz - 1.3 GHz (AOR AR2700)

..vs..

25000 KHz - 1.3 GHz (BC3000XLT)

...the differents is only the bottom end of the receiver (the lowest it can receive). 500 KHz is lower then 25000 KHz.

What you will hear below 25 MHz is...

12 Meters HAM
15 meters HAM
17 meters HAM
20 meters HAM
30 meters HAM
40 Meters HAM
80 meters HAM
160 meters HAM
The AM radio dial (insert you favorite AM radio station here ____)
All the other international broadcasts around the world
Fort Collins
Dr. Gene Scott (that is if you like that sort of thing)

...and the list goes on and on. I don't own either of these radios so that is about all I can help you with. Hope this helped some.

C-ya,

Michael (shotgun@lanminds.com)

Federal prison for just a few cards with $5000?? You got to be kidding.
I've heard that in a big city, the feds won't get involved with any bank
job less than $250,000, it's just not big enough for them.

And just a couple days ago, I heard a story about someone at a Circuit
City who KNEW that someone was calling them to order goods with a stolen
credit card. They call the cops and offer to deliver the goods to trap
the people. The cops don't want to bother, they've got better things to
do.

I think the Federal Gov't (U.S. Attorney's Office) would not try to go against the wished of an favorable agency. ALSO, the Feds don't just show up; they are requested by the offended agency.

: I'm absolutely sure these 'pager notification networks' are far
: afoul of both the letter and intent of the ECPA and are a danger to those
: of us who scan as a hobby by commercial exploitation of monitoring.

Los Angeles is ONE of the largest cities as far as amounts of agencies and action and I have NEVER heard of agencies complaining about freelance coverage as long as the abide by the rules. The L.A. City Fire Commission issues a "Fire Line Pass" to freelancers after the are screened and approved. Many of the publications exist on fire buff photos which are free to them for publications. ALSO, MANY of the agencies use buff photos for their training classes. Buffs are a vital part of the industry in MANY parts of the nation.

: In my experience, yes, the FD does welcome a media presence at fires. You
: seem to imply that they would welcome amateur photographers showing up at
: fire scenes and further clogging their fire lanes, and I'm sure this isn't
: the case.

As I said above, Fire Buffs may apply for a fire line pass. ALSO, ALL citizens are allowed to watch any incident from behind the fire line and even the news media, who is protected by section 409.5d of our Penal Code, can not enter a posted Crime Scene or Interfear with the operation of the agency.

: I agree - as long as the media coverage is favorable and 'ambulance chasers'
: don't start showing up at wrecks, crime scenes and fire. How long do you
: think they'll maintain that attitude if they get overwhelmed by curiosity
: seekers? Or if the media coverage turns critical?
Many times our coverage is NOT favorable and it's our right to cover it! It is the departments problem if they are doing wrong. We recently had choppewr LIVE coverage of a chase that ended with sheriff's officers beating the suspects. It was live and reported by all stations. It was NOT positive for the agency but reflected a problem that is being handled. Some agencies do not allow the 1st car in a persuit to make the arrest because they are to hiped-up and beatings occure. Even coverage of bad situations can make a difference. The media is not here to promote, but to be a mirror of what is happening!

I did not wish to continually take it out of the case, take the cover
off, then plug in every time.
so I cut the slot, and now I just plug the cx12 ribbon right into it.

-Bill Cheek-

There is a growing interest in tapping the baseband audio out of
various scanners for decoding of a variety of esoteric signals,
including CTCSS, SCA, FSK, RTTY, FAX, etc. By and large, such
signals cannot be take from TAPE REC jacks, headphone jacks, and
EXT SPEAKER jacks because of the voice-band filtering that is done
between the signal source and these output jacks.

Therefore, it is necessary to tap the "baseband audio" directly
at the output of the discriminator chip for your scanner. The
below Table shows a list of scanners, the discriminator chip(s)
used in the scanner, circuit symbols of those chips, and three
pins of general interest on the chips: RF-Input, Scan Control,

and, of course, the baseband audio pin.

Even though your scanner may not be listed, if you can find its discriminator chip, it will be listed with one or more scanners below, the pins of which will be the same for your unlisted scanner! Corrections and additions to this list are requested. See my email and other addresses at the end of this file.

HS>My solution was to install a better interface jack.
HS>This mod is NOT for the faint hearted !!!
HS>It involves cutting a hole in the top right side of the 8K and
HS>installing a
HS>6 pin modular quick connect phone jack.(I know the flat cable is 7 pins
HS>but 2 are ground). Also on the computer interface(I used the EDCO) get
HS>rid of the flat cable and solder on a standard 6 conductor modular
HS>cable(6 fee
HS>t works for me)and crimp on a 6 pin plug. For the Scout cable I used 2
HS>conductor modular cable with a 6 pin plug and a 1/8" plug.
HS>This works superior. The battery case can be left on and the protective case
HS>left on you need only to undo the velcro at the top about a inch insert the
HS>pin plug then push the velcro back over the jack.
HS> I can provide the details if intrested.

I have been looking at installing a 9 pin mini-din. Did you investigate this?
My problem is all the mini-dins I can find locally are PC mount, and I need
panel mount.

What you really want are the Hirose mini circular connectors in the
Digikey catalog. But they are way too expensive.

The band buttons on the Pro 2026 are programmed within the units
microprocessor, and as far as I can ascertain, they are not user
programmable at all.

I mounted mine in my little '81 Totyota Corolla (also paid for) in the
ONLY place I could squeeze it...under the central ashtray and behind
the gear shift on the hump with a hump-mount bracket. I had to use a
right-angle adaptor for the antenna due to rear clearance problems
with heater system plumbing, but I got it to fit! The gear shift and
the ash tray are stilkl fully functional too! :-)

An NMO VHF 1/4 wave on the trunk lip and away we go..... no ignition
noise problems either!

>I understand what the virtual downconversion does,
>but I guess there's some disadvantages with it.

In some radios, e.g. the BC9000XLT, I see no disadvantages of
consequence. The 9000 is flexible enough to permit you to change
modes and step sizes from the keypad and you get full 800 MHz
sensitivity.

The BC9000XLT circuit modification details (with schematic)
are described in my June 1996 Monitoring Times column. All
you need do is install one DPDT switch. There are two positions:

1) normal (stock) operation
2) 800 MHz image enhancement

>Would this not shift your whole radio's frequency and
>not just the cellular band.

>Also depending on how much it shifts it you may
>not end up with proper stepping through that part of the band.

Depends on the scanner model and the nature of the modification.

Message-ID: <4o8fbe$mi4@usenetz1.news.prodigy.com>
Source record: 232995

The Pro-43 is triple conversion whereas the Pro-39 is double conversion. The Pro-43 is a little more sensitive. The Pro-43 has the following frequencies that the Pro-39 does not: 225-380 Mhz (Military Aircraft) and 956-999 Mhz. The Pro-39 has frequencies from 108-118 Mhz that the Pro-43 does not have. The Pro-43 allows you to select AM or FM whereas the Pro-39 defualts to either AM or FM in any given band. The Pro-43 allows you to scan your channels in either direction: up or down. I think thats all.

By the way, I have a Pro-39 with cellular for sale at $180 plus shipping.

4225. Toasted my AR1000XLT?

Newsgroup: rec.radio.scanner

From: rjd@platinum.nb.net
Message-ID: <4o8j45$j0a@emerald.nb.net>
Source record: 232996

I have an old ar100xlt that I periodically have to re-solder the power jack to the PCB cause inserting and removing the external power eventually break the solder joints. This last time, when I powered up after the change, the display has F00 and F01. ALso some of my freq programming was gonew. Some (maybe all) freqs were locked out. Finally, worst is that the squech malfunctions. Squelch seems to work except the scan does not stop at the active freq. It keeps scanning or searching. Doesn't matter whether hodl hold or delay ois set.
Any way yto adjust his????

>
>What do you all think?

I have one!! The only thing that i know, i want to buy another scanner.
I have a PRO-44 and i will keep it for scanning easy frequency
while scanning high frequency with a better scanner.
So it's not a bad scanner but i do not recommend the PRO-44....

: : do this??, what are your rights as a scanner??

Solution to your delema: Wear a sport coat or jacket with an inside front
pocket. use a stubby antenna. Put the scanner inside your front pocket.
Listen on ear piece....know one will ever know about your scanner unless
you tell them or take it out of your pocket...I use this trick on planes
and at similar places all the time!!!

DL (Disneyland) in Anaheim uses frequenciesin the 464-465mhz area for most of the security/operations frequencies. I believe the hotel also has a 462mhz frequency. they may also use a 151mhz frequency for submarine control. WDC (Walt Disney Company) is also licensed to use an 800 mhz trunked system in the 856-860mhz range, I believe.
If you are going to DL, also try listening to the Orange County Police agencies in the 460.0-460.6range. Anaheim is on 460.05 and 460.10mhz!

Most civilian ATC facilities simulcast on both VHF and (if available) UHF frequencies. The aircraft, of course, will only be heard on one frequency at a time, although they use both VHF and UHF. Don't forget to search the 138 to 144 mHz area in AM mode. Many forward-deployed units use frequencies in this range to communicate with their ops offices.

Hi. . . . . .

It wasn't the spelling, it was just that you didn't say what kind of
mods you were looking for. I have quite a few databases, but I could
not find any mods for the PRO-32. There have been several RS machines
that don't seem to have any documented modifications, the PRO-32 being
one of them. I think I searched for that one some time ago. That
should not stop you from posting your request in this News Group,
however. You never know when someone will come up with an answer.
You might try using a search engine to look for a web site that has
scanner mods. Try searching for "PRO-32" or "scanners" or
scanning mods" etc., etc....... Here's one to start with. . . .
:

http://www.panix.com/clay/scanning/

Good luck in your search..

4256. 900 MHz phones

Newsgroup: rec.radio.scanner
Date: 1996-05-26 00:00:00 UTC
From: wright@onramp.net
Message-ID: <wright-2605961401450001@dal26.onramp.net>
Source record: 233027

After hearing a news story about a Dallas school board member having his cordless phone conversations recorded by a neighbor and then being presented as evidence in court, I decided to buy a 900 MHz cordless phone. It is an Escort model with spread spectrum technology.

Does anyone know just how secure these new phones are? I haven't yet tried to see if my scanner will pick it up...

BTW, according to the papers, the FBI isn't going to seek prosecution of the neighbor for taping cordless conversations!!!

You're right. They do simulcast. Choice of channels for me depends on which sounds best. My source was the "Official Aeronautical Frequency Directory." Many civilian sites have military aero capability, Meigs Field in Chicago for instance, when they serve as radio control for airshows etc.

Phil...I caught the arrival of the ships on Wed into New York harbor. I monitored 123.05, which is Hudson River aviation traffic. All aircraft that enter the Hudson River air corrider must announce their presence and their plan about their flighht level, landing spot, etc. Anyway, while monitoring 123.05 I heard Snoopy One, which is the Met Life blimp. I also heard Nighthawk announce its entrance from the area of the GWbridge and its plans to have Marine One land on the Intrepid. Shortly after his announcement, the two large Sikorsky copters that mov ethe President, staff and security detail was spotted flying down the middle of the Hudson River. Marine One circled the Intrepid once and landed on the Intrepid. Shortly after, Highthawk announced its intention to fly back up the Hudson past the GW Bridge. I also monitored 123.1, the NYPD avaiation freq, but nothing was heard. Also, no NYPD choppers were spotted in the air. My vantage point was at the Weehawken Park, high above the Hudson just opposite to the Intrepid on the New Jersy side of the river. No traffic heard on NYPD citywide #3, which is normally active also when the Chief comes to town. I dont have anything that picks up the military freqs, but you should monitor these marine freqs...156.8, 156.3, 156.35, 156.4, 156.5, 156.6, 156.65, 161.6, 157.1, 156.425, . These freqs cover an assortment of marine traffic in and around ports and harbors. Good Listening !!!

>I thought the red blue, and greed lines all used the same or similar
>160-161mhz TRAIN frequencies!! JOHN
>

One would think so, however this whole Los Angeles Rail system has been corrupt from the first dollar spent! In example, the LA Rail systems are NOT compatable! Red Line cars can't run on Blue Line and and Green can only run on Green! More to the point, NO line can share equipment on ANY line. There will be a MINIMUM of three vendors for trains. Each vendor will require three DIFFERENT ordering systems, warehouses, qualified maintenence staff, inventories support equipment, etc.!

Originally, Blue Line security was provided by Carson Sherrif. Now it appears that each line provides it's own transit authority agents.

Blue Line: 160.425 Maintenence
472.4875R Road
471.9875R Yard

Red Line: 160.425R Maint.
160.695R Road
161.505R Yard

Green Line:Trunked 939.45MHz / .4625 / .475 / .4875 / .500

Staff: 43.58MHz
Police-Surface Rail: <A> 453.475R
<C>453.625R
460.200R

Now if the above doesn't qualify as a waste of Federal and Local tax dollars, what does? I beleive that one of the real jewels of rail transit lines in America is the Washington DC Metro System. And that system is OLD, but still shows what should be done with rail systems.

It is also outragous that anyone would consider underground rail systems at a known earthquake site, but that it just what they did in downtown Hollywood! Not one real passenger has used that system yet and the underground tunnels are caving in even without the stress of a earthquake! Some storefront properties have walls and srtucture cracks from underground rail construction and blasting.

If esthetics of a above ground monorail system was the objection, they could have installed a MUCH safer and economical system 1 block South of Hollywood Blvd. Our tax dollars at work.

Please let me assure you...

The PerCon SPECTRUM-96 CD is outstanding! Every serious scanner fan should have one, as should every two-way radio shop. I highly recommend this outstanding CD.

In fairness, I add that the cost is $24.95+, not $29.95. This very current data base surpasses every other publication I have for quantity, accuracy and ease of operation. Do not expect to find federal or military information on the CD (darn it)! Just about any other service you can think of IS in there including microwave links!

Understandably, PerCon does NOT allow the enduser authorization to run the CD Data base on any BBS or online service. PerCon does offer LIMITED access to the data at; www.perconcorp.com

From: hh357@aol.com
Message-ID: <4oautj$q9d@newsbf02.news.aol.com>
Source record: 233046

From an acoustic point of view the pro-43 has a much cleaner sound(no whine) in the 800 MHZ range.
In addition the 43 is much smaller, fits the hand better, and the keyboard has ergonomic texture keys.
It probably scans faster, but I can't remember.
The 43 is also triple conversion. Much better in crowded city areas.
cheers

4280. The best NOAA radio?

Newsgroup: rec.radio.scanner
Date: 1996-05-26 00:00:00 UTC
From: mas@scci.net
Message-ID: <4oa5qc$cog@news.gdi.net>
Source record: 233051
Cross-posted to: alt.radio.pirate,alt.radio.scanner,alt.radio.talk,rec.radio.scanner

I've seen a few weather radios with the alert feature that opens the channel when a NOAA weather statement (watch & warning, etc.) comes on... Some at Radio Shack and one from Maxon...

What disturbed me about the radio shack models was the incredibly annoying alert sound for which you could not adjust the volume..

Has anyone seen a "nicer" weather radio that has more adjustments for the level of the alert sound, etc.? Anyone have an opinion on any particular model?

I'd like to leave it on all the time (Hurricaine season in Florida!), but ain't no way I'd leave that radio shack model on...

Please reply direct as well as post the group.

Thanks,

Marc

I've got 4 of them...they make decent paperweights and that's about
it.

Not much need for a cell mod as they appear as images in the 1269+ MHz
range. Give it a try.

I'd like to know if there is any hardware / software combination with which one can connect their Scanner to their PC to receive and decode both Numeric and Alpha pages? Seems to me that I saw a posting several months ago describing how to do this. What I'd like to do is set up my scanner with this software/hardware to make logs of the various pager intercepts.

Any pointers? Also, if anyone out there puts out a commercial product that does this (kit, whatever).. I'd like to hear about that in e-mail.

Thanks
-Jim (root@spacelink.com)

This would make for a very LONG list.

Use these ranges to scan through...

RX: 902.1000 - 903.8400

TX: 926.1000 - 927.8400

There are 59 ch.

Jayson,
USB=Upper Side Band
LSB=Lower Side Band
CW=Continous Wave (Morse Code)
These are modes of transmisson on the HF bands (150Khz-30Mhz).
If you are a Ham and wanted to listen to Morse code, select this mode of
reception and the radio will narrow in on the dits and dahs. Usually
Monitoring Times and Popular Communications will list the Shortwave
Broadcasters that transmit in Upper Side Band or Lower Side Band.
Hams Usually use LSB on 160, 80, and 40 Meters, and USB on 20, 17, 15,
12 and 10 Meters. Let me know if you need more info!!

>> I scanned my own Sony cordless phone, a 46/49 10-channel one several
>> years old, and found that it does not transmit DTMF tones over the air.

I have one of the newer Sony 900 MHz phones (SPP-ER1) and it appears to be
just like an older 49 MHz cordless except it has longer battery life,
a smaller antenna and improved reception.

If I scan on the handset frequencies (902.05-904.00) I get the buzzsaw
effect that several have reported when I hit a key. If on the other
hand I scan on the base frequencies (926.00-927.95) I receive the
buzzsaw for the first 1/10 sec~ and clear tone for the rest of the press.
On the hanset on the other hand you receive a clear tone for the first 1/10
second and a faint reproduction of the buzzsaw with an even fainter
DTMF which the room must be dead quiet to hear. Now I'm not certian
that the *handset's* behavior is normal. Can someone who has this phone
e-mail me and let me know what your experience is? This post has just
been FYI about my scans with the phone. Sony must have some phones which
don't decode the DTMF over the airwaves, but this phone isn't one of them.

YUPITERU MVT-7100 HAND-HELD SCANNING RECEIVER

Covers frequency range 100 khz - 1650 Mhz, with WFM, FM, AM, LSB and
USB receive modes.

1000 programmable memories, 30 channels / second scanning rate.

Excellent mint condition, barely used. Comes complete with quality leather
case, rechargeable batteries, charger and full user-manual. A truly SUPERB
receiver, the only reason I am selling it is because I have lost interest
in the hobby.

UKP 175.00

REALISTIC PRO-2006 DESKTOP SCANNING RECEIVER

Covers frequency ranges 25 Mhz - 520 Mhz and 760 Mhz - 1300 Mhz, with WFM, FM
and AM receive modes.

400 programmable memories, 26 channels / second scanning rate.

Excellent mint condition, barely used. Comes with mains power supply and
full user-manual. Again, I am only selling it due to my lack of interest
in the hobby.

UKP 140.00

ERA MK II MICROREADER

This high-quality device used in conjunction with a good quality shortwave
radio receiver allows AUTOMATIC decoding and display of the contents of the
following types of radio transmission:-

CW (Morse code),
RTTY (Radio Teletype, all speeds),
TOR,
SITOR.

It also has a built-in Morse tutor which is an ideal aid for those studying
for the Radio Amateurs Exam (RAE).

Again, the unit is in first-class condition and comes with full instructions
and a power-supply.

UKP 80.00

I will consider personal delivery of any of the above items to a buyer within a 150 mile radius of Hamilton in Central Scotland. Otherwise the buyer collects or pays for P&P.

James Muir,
Hamilton,
scotland.

We've added a directory of Amateur Radio Equipment specification datasheets to the Ham Radio Online web site at:
http://www.accessone.com/~vbook/hronline.htm

This directory is a large list of pointers to detailed specifications for all new Amateur Radio gear being manufactured today. If you are in the market and looking for just the right radio for you, take a look - this will help you narrow down the choices for the radios that meet your requirements.

Ham Radio Online is self-supported (no ads) and just happens to be the coolest, award winning Amateur Radio web site that looks like a magazine. We feature original stories, newsletters from around the world, in depth real-time propagation, auroral and meteor scatter reports, real-time disaster conditions and much more. Stop on by and have a visit. Let us know if you have ideas for other Amateur radio related items that we should add to our web site.

Thanks and 73,
Ed (KF7VY) and Kim (N7VPL) Mitchell

frequencies that a local courier company here in Minneapolis uses. The
Company is COURIER DISPATCH, they are a division of United Transnet, if
that means anything?.. If anyone has access to a Fcc database and has
thses frequencies PLEASE e-mail me!, your help would be GREATLY
appreciated! :) , Thanks and Happy Monitoring

Source record: 233067

Yes, I own one of those battery-powered pre-amps for my handheld.
I own a Uniden SC150 100-channel.

I've found it is a useful tool sometimes. It boosts 100-1000 MHz with
a variable gain of 3-20 db. However, when you use something like this,
you must remember that these devices amplify EVERYTHING- signal and noise
alike, and that the gain doesn't necessarily change your signal-to-noise
ratio because it amplifies noise proportionally. This can actually hurt
your reception, espically if you're in an urban area where signal clutter
is already a problem.
However, if you live in a rual area and are on the frige of reception of
a station, this can come in handy. Don't get me wrong-it's not bad, it's
just not for everyone in every area. Mine is a GRE SuperAmplifier, but
I don't remember the model number, and cost about $75. In my opinion, it's
a handy thing to have around, so I'd suggest you go ahead and get one
keeping these things in mind.

Sincerely,
Chris Blatchley

That may now only be partially true. Motorola is having so many
difficulties getting it all together, much of what is transmitted may
just wind up being in the clear/analog so everyone can listen. Depends
on how soon they can get it together. But from local people, they may
not be able to. What problems Motorola is running into I can't recall
at the moment. But "grief" is currently their middle name.

The freq range used by your C-130s may also depend on who is
operating them. If it is a Guard unit, you may find them on VHF only.
A regular AF unit would more likely be on UHF, although there is no
guarantee of that.

4331. Trunked Question

Newsgroup: rec.radio.scanner
Date: 1996-05-27 00:00:00 UTC
From: Flint@Orbiter.Com
Message-ID: <833214101701@BBS.Orbiter.Com>
Source record: 233081

Ok, I been thinking about something and haven't been able to make
any sense of it.
My local PD is in a twenty-seven channel trunked system, now
whenever an officer keys up there mic the computer, controlling the
trunk, selects a "clear" channel. and the officer can talk to dispatch
etc. etc. but, the thing I'm wondering is, I've been in the local police
station and there is only two people up front, one answers the phones
and takes care of the people who enter the station. Now the other is the
radio dispatcher. So how does the trunk work? The dispatcher can only
talk to one person at a time. So how is the trunk better than a
conventional system, besides the hassel it gives scanner hobbiest.

Thanks in advance,
Flint

Several stores like Amateur Electronics in Las Vegas, sell an after
market extended range two meter rubber duckie. It's about 10" long
and does quite well on two meters. It also works great on scanners. I
have two HT's and a Pro-39 I carry in a gun case with sevral antenneas
that are interchagable.

I don't know about the pro-43, but I've had my 39 for several years,
and it works great. There IS a problem with the audio, however, this
is a common problem for ALL handhelds. If you hook up an extenal
speaker, it will usually eliminate the problem. I use a speaker mike
for a 2 meter HT, occasionally, and it works great!

I think AOL is one of the biggest problems facing the Internet today. There's a big debate going on online among various website developers and consultants about not "leaving out" the 5 million alleged AOL customers when writing HTML. My personal feeling is "let them get real browsers, sign up with a real service provider, and above all use their real names." I don't have the time to waste on several million 10-free-hour accounts, many of which are used by the same individuals in different guises.

> Anyways Hi D.S. my mail server seem to be down today so here is a

You can say that again. I'm working on adding the Niagara, Hamilton-Wentworth and Halton Regional Municipalities to my website. They'll be up as I have the time to get them ready.

I am also developing a section about US, NY and Canadian scanning laws, which will probably appear very soon. Maybe even today. And I've just obtained a copy of a public domain CGI script called WWWBoard that should allow me to add a somewhat interactive bulletin board feature to the NF2G Scannist Pages. Visitors will be able to leave messages for each other as well as for me.

Yes the new ones are a lot stiffer. Call EDCO for new knobs. They should be under warranty if you're radio isn't too old. Otherwise, they cost about $1 a piece. This makes a lot more sense then gluing the old knobs to the radio, which is what I hear some people have been doing. E-mail me if you need EDCO's number.

The PRO-43 suffers from severe intermod problems in the rail (160 MHz)
band; the PRO-39 does not.

I'd like to know if there is any hardware / software combination with which one can connect their Scanner to their PC to receive and decode both Numeric and Alpha pages? Seems to me that I saw a posting several months ago describing how to do this. What I'd like to do is set up my scanner with this software/hardware to make logs of the various pager intercepts.

Contact K&L Technologies. They have a small interface for around $100. Their e-mail address is K&Lsupport@aol.com

4345. All Regency scanners (SOLD)

Regarding the AR8000 knobs. When I got the radio, they seemed to flex on the shaft too much also. It's because they are neoprene all the way through, therefore on a metal shaft they do not grab as well. I took a 1" x 1/8" strip of electrical tape and wrapped it around the top of the squelch and on/off/vol knob brass shafts, just above the notch in the shaft. Carefully push the knobs back on, making sure the gray rubber inside the knob actually 'snaps' into the notch again and that the tape does not bunch up on you. The thickness of the tape seems to make the knobs hold a lot better. Also I put a neatly laid strip of white silicone seal in the knob knurl trough opposite the gray dot on top (used a small needle). Can see squelch and vol settings from the front instead of having to turn the radio up to see the gray dots. Worked for me! I also tried to find new knobs that were hard plastic with white indicators and metal set screws, but no luck. But the elect tape and silicone seal trick did well.

Mike

4347. strange tone?

Newsgroup: rec.radio.scanner
Date: 1996-05-28 00:00:00 UTC
From: gshell@iac.net
Message-ID: <31ab3d04.292475@news.iac.net>
Source record: 232897

I just got back from the US 500 where I used my new Bearcat SC150. I noticed something with it that I had also noticed with my old Regency HX2000, namely there is a strange whistle tone on most of the channels I was scanning. I'd hear it along with whatever voice I was picking up, race control or pit to driver conversation. It was a steady state tone at about 2khz (a guess). My question: is a normal situation? Any way to get rid of it?

Also using a standard closed ear stereo headphone (Fostex) I'm not getting as much volume as I'd like (or need). The trackside PA was REAL loud where I was sitting and made it tough to hear some of the drivers. Could thi be from an impedance mismatch between the phones and the scanner, or just not enough umph coming from the scanner in the first place?

Thanks!
Gary Shell

Mark E. Daniel (lsi@aldhfn.aldhfn.org) wrote:

: If I scan on the handset frequencies (902.05-904.00) I get the buzzsaw
: effect that several have reported when I hit a key. If on the other
: hand I scan on the base frequencies (926.00-927.95) I receive the
: buzzsaw for the first 1/10 sec~ and clear tone for the rest of the press.
: On the hanset on the other hand you receive a clear tone for the first 1/10
: second and a faint reproduction of the buzzsaw with an even fainter
: DTMF which the room must be dead quiet to hear.

What I think is going on is that the phone, like mine, uses only buzzsaws
for the handset to communicate the button presses to the base. The
reason they do this is that their circuitry has to be able to handle
all the keys on the handset. A typical Sony phone has probably 10
or more keys in addition to the 12 number keys. It wouldn't make sense
to have one protocol to send the "other" keys and DTMF to send the number
keys. The "buzzsaw" protocol they use can send *all* keypresses to the
base, and is probably more error-resistant than sending the DTMF tones
over the air. People do not like it very much to dial a number and be
connected to another one. With the DTMF encoder in the base, this is
less likely to happen.

What you are probably hearing on your scanner is an "echo" of the DTMF
tone generated by the base and sent out the line.

What I meant was not what you LISTEN to, but how do you mount the radio
so you can drive and operate it and listen to it in a reasonable way.
I'd be afraid to leave the thing just sitting around because it could go
flying around during a sudden stop.

Glass mounts work great....Unless it's VHF-Low. I have a glass mount and
it's pretty good but below 118MHz it sucks, I barely hear CHP when I'm
down there.

Follow the threads about the Standard AX-400 once they hit the street this
week. AOR also has a tiny, competing (if not the same) model in their new
line-up. Patience. Tiny scanners tend also to have tiny performance.

Greetings to Marc and the group,

As far as the alerting feature on RS's weather radio, it is designed to get your attention whether awake or asleep. This I believe, as you also found out, it does rather well. In my oppinion, the major weakness in the RS radio is that you must then push a button to open it up to hear the warning. Depending on how close you are to it, you may miss important information. To want to be able to turn down the volume of the alerting 'noise', to me, would be like wanting to turn down the volume of your smoke detector, a somewhat counter productive move.

What would be great would be to have the option to have the radio open up upon recieving the warning tone from the NWS without the alert 'noise' from the radio. In addition, having it go back to mute after a set time period would also be useful. Radios, other than RS have at least the auto-muting feature. RS is just a bit more convenient to buy.

From my experience working with the NWS through their SKYWARN program, here is a list of what I consider desirable weather radio features in no particular order:

Automaticly opens up when it receives alert tone.

Option of having alerting 'noise' or not when it receives warning tone.

Automatically mutes after set time period. (Would be nice to be able to set time period.)

AC powered, AC cord attached, with battery back up (min 12 hour).

In addition to attached and collaspable whip antenna, external antenna connection, prefer BNC.

MSRP no higher than $39.95.

As yet, I have not seen a weather radio or a product discription of one that has all of these features.

Joe,

I use a device called a "Clip Mount." It's the female portion of a heavy duty plastic clip called (oddly enough) "The Clip." The Mount has double backed tape and I place it on a smooth part of the car dash. Then the AR8000 and its Clip hang right there. I have also "Mount"ed an Opto Scout and a small cell phone.

Another device attaches to the car window with a suction cup, hangs a long thin arm over the dash, and has a clip holder on the end. Also developed by the Clip people. If you can't find them at Radio Shack or Wal-Mart, call 1-800-theclip. They'll tell you how to get some locally.

Some really useful products.

Harold

I spent quite a bit of time at the OPTO booth at Dayton, and hey stated
that the Xplorer would NOT reaction tune the AR8000, etc. When I asked,
they said "what's the point-the Xplorer would give you the audio".
They were demonstrating their mapping program with software that I
believe will be produced by Percon. The Xplorer with GPS unit would tag
the coordinates with each signal received, and after downloading the
data to a computer, each signal could be mapped out. They will start
shipping Xplorers in about 7 weeks per info from the OPTO people.
Time will tell!

I think you meant to say that the FTT-12 option affords you CTCSS decode.
My radio when it came with the standard keypad DECODED DCS (DPL) already.

I agree its one of the best multi use radios around.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of |
the author.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available |

The re-incorporated Electra Corporation, (317)326-4419, is |
able to effect repairs on some older (pre-Uniden) Bearcat |
scanners. They sell crystals, antennas, power cords, |
owner's manuals ($11 ea). Electra Corporation is located |
at 251 N. 300 W. Greenfield, IN 46140-8496. |

Some schematic diagrams may be obtained from
Uniden/Bearcat's parts department, (800)297-1023. Uniden |
currently charges a flat rate of $54 for scanner repairs.
They will repair and return "out of warranty" items without

an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297- | 1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. *

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all | have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually

available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of |
the author.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio
worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base | scanners, see "Tips for Fixing Bearcat Scanners," by Bob | Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" | and carving the letter "U" on the cabinet. |

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. |

The re-incorporated Electra Corporation, (317)326-4419, is | able to effect repairs on some older (pre-Uniden) Bearcat | scanners. They sell crystals, antennas, power cords, | owner's manuals ($11 ea). Electra Corporation is located at | 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow

band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM | receive capability, like the flamboyant turquoise Sonar | Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec | MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE | Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the

channels at one time.

All the older Radio Shack scanners were made by General * Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency | and Electra (Bearcat) built most of the scanners in their | Indiana and Puerto Rican factories. Uniden, a large | Japanese electronics company, purchased the scanner product | lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat | BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO- | 2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and | older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews of these scanner models |
in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT |
Mar 1987 - Radio Shack PRO-2004 |
Oct 1990 - Radio Shack PRO-2006 |
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements

Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable |

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the

Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel

interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a |
keyboard and numeric display. LED readout. |

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good |
scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so

factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of | preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. |

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification | information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable | scanner which is a smaller successor to the BC200XLT. | Includes 800 MHz band. 10 priority channels. Service | Search, including WX. Up to 10 frequencies can be locked | out during conventional search, 20 frequencies from Service | Search. Unique feature tells whether a given frequency has | already been memorized. 10.8 MHz and 450 kHz IFs, with | images 21.6 MHz away. 4 cell BP-120 internal NiCd battery | pack. Marketed as BC230XLT with two BP-120 battery packs | and CRX-120 dual charger. See "The BC220XLT/BC230XLT | Portable Scanner," by Bob Parnass, AJ9S, in Monitoring | Times, April 1996. |

BC230XLT (Uniden): See BC220XLT. |

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity.

Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency | control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable

performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004

Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042,"

by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1985 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are

unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went | out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For

more information, see "Add a Crystal Receiver to Your
Arsenal," by Bob Parnass, January 1996 Monitoring Times. |

Custom Color Map & Report |
of Transmitter Sites Near You |

As I have already done for hundreds of radio enthusiasts, |
companies, government agencies, and organizations across the |
country, I will locate FCC licensed and selected FAA and CAP |
transmitter sites in an area of your choice, in any state, |
and produce a custom RadioMap(TM) report, including an 8- |
1/2" by 11" scaled color map, protected by plastic. The map |
is marked with transmitter sites, cities, highways, |
airports, military installations, national parks, etc. |

RadioMap allows you to identify antenna sites and visualize |
the transmitter locations in your neighborhood, near your |
office, and other places of interest -- from VLF through |
microwave. The report lists frequencies, callsigns, and |
licensee names. RadioMap covers police, fire, local |
government, TV, business, industry, common carrier, |
railroad, trucking, and many more types of transmitter |
sites, excluding ham radio stations. Wireline and |
nonwireline cellular phone and AM/FM broadcast transmitter |
sites are clearly marked using unique color icons. |

Industrial customers use RadioMap reports to survey the |
"radio environment" prior to installation of radios and |
wireless microphones at customer sites. RadioMap is used by |
the maritime and broadcast industries, as well as ham radio |
operators to solve intermod interference problems, and has |
been very favorably reviewed in RCMA Scanner Journal, |
American Scannergram, and USSN. |

The RadioMap processes and software are unique and |
proprietary. Unlike "more tame" maps, RadioMap shows the |
locations of military bases, ammunition plants, arsenals, |
weapons factories, and other military installations. |

For a flat fee, you choose the center location, and I choose |
the range, depending on transmitter site density: |

suburbs: 5 mile range (100 sq. mi. area) |
rural areas: 10 or more miles (400 sq. mi. area) |
dense urban area: 1 - 2 mile range |

Longer ranges for additional charge - call for pricing. |

A custom RadioMap report costs $20.95 plus $5.00 shipping |
and handling. For an additional $4.00, I will include a |
custom frequency allocation histogram, a 0 - 1,000 MHz |
"spectrum analyzer-like" display showing spectrum usage by |
the transmitters in the map coverage area. Send check or |

money order payable to Bob Parnass for $25.95 for standard |
or $29.95 for deluxe RadioMap report with histogram. |
Include your name, address, and telephone number, along with |
center location (nearest intersection of 2 streets, or |
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas |
Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central |
time. For a brochure, send SASE. |

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of |
the author.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local

agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of | the Spectrum CD for free via PerCon's web page at | http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA | and CAP transmitter sites in an area of your choice, in any | state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways,

airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained

80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of | Information Act (FOIA). (See "The Government Giveth, the | Government Taketh Away", by Richard Prelinger, in | Monitoring Times, July 1982.) |

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. | (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.) |

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a

monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them. |

If you don't have a VOX recorder, consider a device like | the NiteLogger II tape recorder controller, made by | Benjamin Michael Industries. It connects simply between | scanner and recorder and contains sound activation | circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was

on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping

transmissions, scanner enthusiasts can unearth new
information.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of |
the author.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two

companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA | and CAP transmitter sites in an area of your choice, in any | state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $27.00 per year, which includes the monthly Scanner Journal, approximately 50 pages in 8-1/2" x 11" format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

HAMFEST/COMPUTERFEST CALENDAR 1996 - NORTHERN ILLINOIS
last updated May 6, 1996 |

o Please report additions or changes to Bob Parnass,
AJ9S, office phone: (708)979-5414, electronic mail:
parnass@bell-labs.com. Thanks to Dennis Dale and ARRL |
for providing some of the information.

JUNE

June 2 (Sun), Princeton, IL - Starved Rock RC. Bureau
County Fairgrounds. Admission $5, free parking. Info: Deb-
bie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-
1710, tel. 815-795-2201 Usually an excellent hamfest, with
sellers from Illinois, Iowa, and Wisconsin.

June 9 (Sun), Granite City, IL - Egyptianfest '96, Egyptian
Radio Club. Granite City campus of Belleville Area College,
1/2 mile south of I-270 on Ill Hy 203 at Maryville Road.
8:00am to 1:00pm CDT. Annual hamfest, computer fair and
fleamarket. VE session, food and drink, indoor dealer /
exhibitor area. Talk-in 146.79 MHz. Info: Egyptian Radio
Club, P.O. box 562, Granite City, IL 62040, call Bill Dusen-
bery N9OQK at (618) 398-1456.

June 30 (Sun), Wheaton, IL - Six Meter Club of Chicago.
DuPage County Fairgrounds. Outdoor and indoor flea markets. |
Gates open 7 AM. Buildings open 8 AM. Admission $5 at
gate. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. No |
booze allowed. Tickets available from Mike Corbett, K9ENZ,
606 So. Fenton Ave, Romeoville IL 60446. 24 hour hotline |
for info (708) 442-4961. Good hamfest which moved from
Santa Fe Speedway to Wheaton this year.

Jun 30 (Sun) - Computer Central, College of DuPage (see
notes at the end of this article).

JULY

Jul 13 (Sat), Oak Creek, WI - S. Milwaukee ARC Swapfest.
American Legion Post 434, Shepard Ave. Admission $5.
Talk-in 146.52 MHz. Info (414)762-3235.

Jul 14 (Sun), Sugar Grove, IL - Fox River Radio League.
Waubonsee Community College, Rt. 47 at Harter Rd. VEC test-

ing. Admission $5 at gate, free parking. Info: Diana WD9API, (708)293-7485. Fair, small to mid-sized hamfest.

Jul 27 (Sat), Pecatonic, IL - Rockford ARA Hamfest. Winnebago County Fairgrounds. VEC testing at 1st Baptist Church, 7th & Washington. Admission $5. Kids 10 and under free. Info, Marsha Plasters (815)399-9233 or Diana White (815)645-8545.

Jul 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

AUGUST

August 18 (Sun) - DuPage ARC, Stickney, IL. DuPage ARC Hamfest Computer Show. Hawthorne Race Course, 3500 S. Cicero Ave. Air conditioned exhibit hall for dealers. Outdoor fleamarket spaces free. 8AM - 2PM. 6 AM setup. Admission $5. Kids under 12 free. Talk in 145.25 MHz. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517. tel: 708-985-9256.

August 25 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. Admission $5 at gate, free parking. Kids under 12 free. Info (voice/fax) (708)658-1678.

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info: Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville, IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. RadioFest96. Holiday Inn Holidome and Convention Center, 345 River Road, Elgin, IL 60123 Ph. (708)695-5000, (847)695-5000 After 01/20/96. Info: Jeff Aulik, 1708 Parkview Ave., Rockford, IL 61107 or Carolyn Knipfel, RR 3, 200 Langhorn, Morton, IL 61550.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria, IL 61612-3508, tel: 309-694-2649

Sep 21 & 22 (Sat & Sun), Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. Starts 6 AM. Buildings open 8 AM. VEC testing. Info, (708)457-0966. Usually one of the best hamfests in NE IL.

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

I am having a hard time understanding why there are so many posts asking for frequencies, for common places. Could anyone imagin what this group would be like if someone did post all of the frequencies asked for? Folks, at any one given time there are over 50 books published with more than enough frequencies in them to keep you busy for months. All of the answers you are looking for are in these books. There are even CDROM's out there now.

Lets look at some of these message subjects and see.

Olympic Frequencies - Been published in this group too many times already.

Orange County, CA - Too many pages in police call to even worry about counting them all.

CB Frequencies - Get real.

Cordless Phones - Published everywhere, including manuals for the phones. Totally talked out in this group.

SF Bay area/Yosemite Park - Published in both local and Fed freq books.

Airlines - Published in so many places it is too funny to even ask about.

Military Aircraft - Like the military aircraft use frequencies any different than any other airplane. Either way, published in two places I know of.

Disneyland - As a lifetime pass holder, I have been hundreds of times and have yet had time to monitor rides. Riding the rides is much more fun. Besides having a scanner on while on a ride is like those morons who use flash photography and blind you in the ride.

Buffalo NY
Plantation, FL All of these big cities are not published anywhere.
Austin, TX Yhea right! Too many trees have died for these.
Simi Valley, CA

Having a scanner without a frequency book is like having a scanner without a antenna. I have a small collection of books and CD's. I only have 10 books and 1 CD. Some people have 50 books and god knows how many CD's. These books are not that expensive. They are worth a whole lot more than $10.00 if you want to monitor something. Some get updated every year. Others every two. Some are local, and others cover all 50 states.

If you are new to scanning here is what you NEED to do. Find a place that sells these books. CB radio shops, Ham radio stores, Radio Shack, and many others. Buy two books. One book should offer frequencies that are considered "local" to the area. So if you live in bumb f*ck nowhere, your local book should cover bumb f*ck nowhere.

The other book should cover the United States. These types of books should cover state and federal agencies, and some big cities. Broken down into a listing by state. Using this resource when you traval you will have somewhere to start. When you get to where you are going, you can then get a local book for that area. Think of it as buying maps when you drive accross the country.

The next step is to USE THE BOOK!

Thats all. It should be fun reading all of the replies.

I can hear cellular on in the 850mhz up to 940mhz on my scanner which was never modified. What is the difference between what I hear and what you hear on a modified scanner. My other question is I have a pro 2026 and a pro 41. Can they be modified fot the 300 mhz band?

What you are hearing are analog phones, like the Panasonics.

Tropez, Escort, AT&T, and the top of the line RS are all digital and some
are even SS.

You won't here these with a scanner!

I ordered mine from EDCO about 6 months ago. They came a few of days later.
Yes indeed they were about $1 a piece but they charged me 4 bucks shipping.
When I got the envelope, it only had $2.35 US postage on it.

> like the alpha tagging of the AOR, but apart from that what is the
> difference?

I'm not sure of any exact differences (technical I mean), but I can point out the following from personal experience. The AR8000 is better looking, more sturdy and comes with a rubber aerial. Unlike the MVT7100. It has many more functions, easier methods of storing memories, and the alpha tagging which is what made me get mine. Then of course you have the computer interface, which I am hoping to get very soon now, which brings in a new world of scanning :-) Which one sounds best at the moment?

> How does the performance of the two stack? How are they to operate,
> which is the most user friendly? How does the PC interface on the 8000
> work? What are the "lots of problems" with the 8000?

Problems? AR8000? Ummn, none really, AFAIK. I've only had 1 problem with mine, and I rectified that within an hour. Triple conversion, alpha tagging, 2 different operating modes, computer control, password protection, efficient entry of memories ... The AR8000 has it all :-)

>ALL the audio, no matter WHAT, no matter WHERE, it's EVERYTHING!

>Mark, KB6KGX

Actually the JPL club does it on 224.08, it's some other ham with
a sat dish that gets it off the bird and dumps it on 448.5
JPL doesn't rebroadcast the NASA news conferences or other stuff,
just the actual shuttle stuff. Different NASA feed or something.
Also their audio is cleaner and doesn't have the extra time delay of
going up to the bird and back...

Also, what do you do with the radio itself while it's in the car? Anyone have good ideas?

BTW, don't try to read the AR8000 manual and drive at the same time, it's kind of heavy reading. You won't live long if you do this. Pre-load the radio with the freqs you want then when you're in the car all you do is hit one button to get the search or scan bank you want.

JW>jeff

I've tried scanning the Uniden spread spectrum cordless phones. It doesn't
even break squelch on the scanner.

It may be possible that somebody could buy a similar phone and hack
it into a spread spectrum scanner.

I haven't had any problem picking them up, in fact the reception is alot
clearer then some Cell's...

However there are 59Ch. You wouldn't catch me programing all those
channels. I enjoy the emergency services more then menial phone chatter.

Cheers.

>LIMITED access to the data at; www.perconcorp.com

The US Supreme Court has held that lists (of anything) are not copyrightable,
but the search engines (i.e. the program included) are. Therefore, if you
take the data on the Percon CD and make it a Microsoft Access database,
for example, and allow Web users to access it, that is fine. Even if they
include "special" data records. This was brought up by some of the
telephone book CD-ROM companies.

I'm looking to buy wither an AOR8000 and the MVT7100. I must admit I like the alpha tagging of the AOR, but apart from that what is the difference?

How does the performance of the two stack?
How are they to operate, which is the most user friendly?
How does the PC interface on the 8000 work?
What are the "lots of problems" with the 8000?

I might also be a bit biased towards the AOR as I've had a 3000 for several years, that seems well built, stable (since the old processor was upgraded several years ago to remove the PLL lockup problem) and well supported.

Let's get the discussion going....<g>

>: .....dave30@olympus.net

I have heard that glass-mount antennas do not suffer "much" loss, but
I don't put too much stock in that. I picked up the Radio Shack mag-mount
scanner antenna for $29, added a splitter, and it feeds both my AR8000 and
my Scout. Works quite well! I mounted them on a gooseneck so they are
facing me if I glance down towards the front of the passenger seat.

>Also, what do you do with the radio itself while it's in the car? Anyone
>have good ideas?

I listen to police and fire, plus the local traffic choppers aren't a
bad idea. They spit out info much more often than the every 10 minute
report on the local AM station. With the Scout it's much more fun.
I reaction-tuned a high speed chase involving the state police
(whom I normally do not monitor as they really only do traffic violations
in my area - the county police do the rough stuff). I would have completely
missed it were it not for the Scout.

>buy them that way!

The AR8000 is newer, has a nicer display (4 lines instead of 1),
covers more spectrum (1.9Ghz instead of 1.3), and has more features
(expert/normal mode, attenuation, etc..). Both can be computer controlled
and hooked to the Opto Scout for reaction tuning.

Oh, the 8000 costs more. <<grin>>

Glass mount is about the only thing I you'll find at Radio Shack (the
scanner shop referred me there), and yea it works fine. The caution in
the instructions manual about not mounting it closer than 2" to the edge
of the window is to prevent interferrence from the metal (which acts as
an antennae) and doesn't apply to fiberglass.

Scan lots!

> >that could actually be used without $20,000 pieces of equipment and so on.

There have been many articles in QST magazine describing circuits and methods to locate transmitters. This is a popular amateur radio sport in the U.S. and Europe. In the U.S. it is called Fox Hunting or Transmitter Hunting. Check with a local amateur radio operator or club for more information.

One book on the subject is "Transmitter Hunting Radio Direction Finding Simplified, Moell and Curlee, Tab Books Inc. It describes many radio direction finding circuits and methods.

For those not interested in building their own electronics there are sources of prefabricated systems. One nicely packaged locating unit, the VF-142Q, is used in conjunction with your receiver or scanner. It is made by Radio Engineers - Technitron, 7969 Engineer Rd, Ste 102, San Diego, CA 92111, (619) 565-1319. I have no interest in this company but I have used this unit with my Icom R-1 and it works quite well.

4410. Problem with scanner...

Newsgroup: rec.radio.scanner
Date: 1996-05-28 00:00:00 UTC
From: murphy@warp6.cs.misu.NoDak.edu
Message-ID: <4of2f6$cgj@daily-planet.nodak.edu>
Source record: 232988
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am having trouble with my pro 44 scanner. About a week ago, I was listening to it and the batteries seemed to be going dead. I took it in and put the charger cord on it and let it charge up. About 3 days later, I took it with me and it on. I noticed I was not hearing anything. This is really unusual for my area. (There is a ham repeater that has voice id every 10 minutes, so I would have at least heard this) I could not even pick up the NOAA continuous weather broadcast at 162.400. I tried reprogramming all the freqs in agian, but this did not help. I even called my pager, to see if I could hear it on the scanner, but nothing.

Does anyone have any ideas?

Any help or suggestions would be greatly appreciated. Thanks in advance to anyone who replies..

Its been years since I flew out of Anoka Co. but at the time the tower
was only operational on weekends and we used the unicomm freq during
the week. Grab the yellow pages and get the number for one of the
flight schools and give them a call. They should be able to give you
a quick run down on the current setup.

>Like to hear about the the FT-50r's operation as a scanner. Speed,
>intermod, etc... Also, how is it on battery life?

I bought a Yaesu FT-50R dual band HT last week
and added the FTT-12 CTCSS/DCS tone decoder option.

In general, I use an HT as a scanner outside the ham bands at
least often I talk with it in a ham band. The FT-50R is better
than most of the older model HTs for this job. Still,
it's not as fast or flexible as some scanners.

It scans memory channels in the conventional sense
and boasts 3 search banks. Memory channels can be
locked out from the scan, but there are no search
banks, as one finds in a conventional scanner. I measured
the scan speed at about 10 channels/second.

The receive frequency coverage is generous but it won't
cover the VHF-low band.

The FTT-12 option affords DCS (digital coded squelch)
decoding which no conventional scanner offers. Although most
public safety transmitters employ CTCSS (analog encoding),
a nearby police agency uses DCS and there's other chatter
on the same channel from competing users.
Having a DCS decoder lets me listen to the locals
without stopping the scan on the unwanted traffic.

Haven't measured the SINAD sensitivity yet because I'm
still awaiting the proper cable to plug into the
headphone/earphone jack.

Haven't heard any intermod during the past 3 road trips,
but that's not a thorough test.

I have two bearcat scanners a BC140 and a 210XL. Both have the same problem. I cannot receive anything. I know it isn't the speaker because I can hear static when turning the squelch.

Is this a common problem that I could fix without sending it out? All help is appreciated. jgoldstein@monmouth.com

Bob Parnass published a keyboard trick for the 9000XLT in the June MT.

He said there are more tricks in the service man. Anybody got them?

BTW, Bob's trick is

Turn unit on with these keys pressed:

DELAY,2,9

Then press LOCK and PROGRAM

You get a surprise (not a reset!)

Turn unit off/on to clear the surprise.

4421. Re: Delta

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4oiga3$jc@HOPPER.ACM.ORG>
Source record: 232799

Delta Air Lines has one of the more enlightened policies about PEDs - Personal Electronic Devices. They allow scanners at cruising altitude, but not during climb or descent, nor anytime on the ground. For a copy of the text of the FAA regulation governing PEDs aboard US airliners (FAR 91.21), plus the official policy of a number of airlines, see:

ftp://oak.oakland.edu /pub/hamradio/docs/misc/ scan.airline
CompuServe HamNet Forum Lib 2 AIRLNE.TXT

A couple of suggestions: if you carry the scanner aboard, program NOAA into one channel so you can demonstrate it at the X-ray checkpoint; and use an earphone in the terminal as well as at altitude.
On the ground you might listen to the tower, ground control, and the airline's gate & dispatch freqs. Clearance Deliv., Gate Hold and Departure Cntrl are not particularly relevant, as you can't listen while taxiing or climbing.
At altitude the significant frequencies are the ARTCC enroute channels, but you'll need to know what is used on your route. If you have the first one, you may hear the handoffs when the controller tells the pilot what to switch to. You'll have to put the antenna right next to a window to receive anything other than your own flight crew.

For reference, the principal frequencies in roughly the order a flight might use them, are:
ATIS - Automated Terminal Info. Svc, recording with airport info
Dispatcher - airline company freq.
Clearance Delivery - flight plan approval
Gate Hold - aircraft prior to movement
Ground - controls taxiing aircraft, located in the tower cab
Tower - controls aircraft while landing & taking off
Arr/Dep Cntrl - arriving & departing aircraft in the airport vicinity
ARTCC "Center" - controllers handling enroute aircraft

Based on what I read in the papers today, the Blue Angels look like
they might be out of commission for the rest of the season. Their
lead fly guy just called it quits. Something about personal training
problems...

4425. Trade 2016 channel unblocked scanner for AR2700

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: Nick Marsh <nickwb4sqi@wwd.net>
Message-ID: <31ACD27B.2EEC@wwd.net>
Source record: 232803

I have an AR2515 base scanner, 2016 channels in 78 banks, 62 banks of 32 channels and 16 banks of 2 channels for search. covers 5 mhz to 1500mhz with no blocks of any kind, am fam and wfm.

I need something like the ar2700 or bc 3000 for my travels. The 2515 looks like the ar3000/3000a.

4426. AR8000 database and communications package

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: Dantin <Jadantin@uky.campus.mci.net>
Message-ID: <31ACE36B.777A@uky.campus.mci.net>
Source record: 232804
Cross-posted to: rec.radio.scanner,alt.radio.scanner

The latest version of the FREEWARE database and communications package for the AR8000 is now available for downloading. Check it out and let us know what you think of it. This package was developed for those of us who don't want to do real-time control of the radio - we just want to manage our frequencies, memory channels, and search ranges. You can find it at:

http://www.rpmdp.com/scanning/ar8000/ar8000-3.zip

The details:

The AR-8000 Database, Version 3

Requires Microsoft Access 2 or newer
Requires VBRUN300.DLL

This package consists of two applications - an Access database for managing your frequencies and AR8000 channels, and a communications module that handles the uploading and downloading of the data between your computer and the AR8000.

Expand the two ZIP files into a directory \AR8TERM. You will also need a \TEMP directory. If these directory names are a problem for you, we can help you move things around.

WARNING: This Access database is in a development state. It has been posted here for your examination and testing. BE EXTREMELY CAREFUL in using it to download to your AR8000. We have tested it, but no guarantees! Please play with it, examine the files , use it, and let us know what you think. This is a FREEWARE project.

The basic premise of the program is that you will manage your frequency files and channel assignments in Access. Once you are happy with the information, you create a text file to upload to the AR-8000. You do have the ability to import frequency data fro m the AR-8000, but you cannot import the current channel assignments, just frequency data. This would allow you to grab some frequencies that you have either manually entered or captured in the AR-8000 and permanently store them in the frequency file.

Once you build a Frequency file, using the Frequency Management form, with your favorite frequencies, you will create a Channels file (using the Channels Management form) that assigns a frequency to the radio's channels. When the Channels file is set up t he way you want it, you export the data to a file and upload it to the radio. See the README.1ST file in AR8TERM.ZIP for information on the communications functions.

You can save and manage multiple channel assignment files - this allows you to have preset configurations for your radio to handle different scanning needs. Maybe you want a set of frequencies for shortwave listening, and another set for when the Presiden t comes to town. Each channel file can contain from 1 to 1000 channel assignments - ONLY the channels with a frequency assigned to them are downloaded to the radio - the remaining channels in your radio are untouched. This is a lot harder to explain than it is to do! Email Jim if you need help!

You can perform similar actions with search banks. Create and edit search ranges with the Search Range Management form. Then assign the searches to banks with the Search Bank Management form. You can save and restore searches just like channel assignments . The export file and download functions are the same as for channels.

The predefined reports give you a compact channel assignment report and a rather lengthy frequency report. Feel free to create additional reports for your needs - just let us know if you come up with something that other users might like!

Have Fun!

8khz - 35khz Recorder Audio Servo Noise (10-20khz Common)

7khz - 35khz Video Camera VLF Detectable emmisions
15.750 mhz Common NTSC Video Camera
15.734 mhz CCD/PCB Video Camera (very easy to detect)
15.625 mhz Common Video Camera

Also, be aware of ultrasonic/audio emmisions from most VLF devices.
(Utilize a EOD/Bomb Tech Stethoscope, and Ultrasonic Spectrum Analyser)

Commonly Used Law Enforcement Bugging Frequencies

37.000 - 952 mhz FCC Surveillance Blanket Authorization
47 CFR 90.19 "Physical surveillance, stakeouts, raids..."
Straight AM/FM, FM-Subcarrier, SSB, Spread Spectrum, and Hoppers.
If encrypted, it usually uses in-band voice inversion or DES.
(Normally well under 2 watts... most under 35-150mw)

148 - 174 mhz
135 - 250 mhz Out-band Wireless Microphone
174 - 216 mhz In-band Wireless Microphone
350 - 440 mhz Common Video Freqs
380 - 930 mhz Wide Band Hoppers
806 - 824 mhz
851 - 869 mhz
905 - 930 mhz Popular Audio/Video Band

1.4 - 1.5 ghz Common Video Freqs
1.7 - 1.9 ghz Common Video Freqs (1.710 - 1.755 REAL Popular
at 1/10 watt)
2.4 - 2.5 ghz Common Video Freqs (2.400 - 2.450 REAL Popular)
5.7 - 5.9 ghz Common Video Freqs (5.725 - 5.850 REAL Popular)
8.5 - 10.8 ghz Common Video Freqs

AID - Westinghouse/Audio Intelligence Devices, Inc. Bug Freqs
150 mhz - 174 mhz Standard/Primary Band (Most Popular)
135 mhz - 150 mhz Special Order/Secondary Band
216 mhz - 220 mhz Special Order

400 mhz - 470 mhz UHF Repeaters

36 mhz - 39 mhz Very Low Power WFM (.5mw - 50mw)
Very Dangerous
80 khz - 200 khz "Line Carrier" Microphone Systems
Very Dangerous

1700mhz - 1900mhz 25-250mw Video and audio bugs
(Mostly DEA/DOJ stuff)
2450mhz - 2484mhz 25-250mw Video and audio bugs

If the signal is "scrambled" it is nothing more than simple voice inversion, a circuit to "de-scramble" costs around $20.

Note: AID devices are often re-tuned for outband channels... so be careful.

The area of spectrum from 35mhz to 500mhz is the primary threat, 500mhz to 3ghz is the secondary threat, a "line carrier" threat is from 30khz to 750khz.

If the person planting the bug suspects that a TSCM may be conducted then AID suggests a frequency between 30mhz to 50mhz, sensitivity of rcvr should be better than .18uv/-122dbm.

Also, keep in mind that AID devices are frequently used for illegal buggings, so be familiar with what their realistic specs are, expect power outputs under 50mw, and expect to see the AC power circuits being used as the antennae.

Security Research Bugs
145 mhz - 175 mhz FAST-II-L Computer Bug - 1, 3, 10, 30, 100mw
170 mhz - 204 mhz FAST-II-H Computer Bug - 1, 3, 10, 30, 100mw

60 khz - 200 khz "Line Carrier" Microphone Systems
Very Dangerous

1.1 ghz - 1.4 ghz 250mw Lynx Video/Audio Bugs (L-Band)
2.5 ghz - 2.6 ghz 250mw Lynx Video/Audio Bugs
3.8 ghz - 4.2 ghz 250mw Lynx Video/Audio Bugs

Note1: LYNX video bugs and cameras are frequently built into old bricks, wooden joists, logs, gate posts and such... VERY, VERY Dangerous and easily concealed.

Note2: Most Security Research Bugs utilize fixed frequency inversion to protect against detection, the most commonly used frequency is a 1.862khz inversion point.

904 - 912 mhz "Bumper Beepers"
918 - 926 mhz "Bumper Beepers"
926 - 927 mhz "Bumper Beepers"

WARNING:
The area between 900 mhz and 6 ghz is ** EXTREMELY DANGEROUS ** as the eavesdropping equipment in that range is inexpensive, low power, and highly directional.

Additionally, most TSCM people will not check frequencies above 1.0/1.5 ghz or 3 ghz (because the equipment is too expensive for them to buy).

I have seen surveillance video tapes of TSCM inspections where the video cameras (Watec), microphones (Sony), and microwave RF transmitters (AID - 2.4ghz) were never detected by the inspectors (using 1ghz AVCOM Spectrum Analyzers).

Surveillance Satellite (TK-Keyhole) Frequencies
Note: Mostly Wideband Spread Spectrum/LPI channels

10.00 ghz - 10.50 ghz 3.0cm Amateur Radio Equipment (47 USC 97.305)

24.00 ghz - 24.25 ghz 1.2cm Amateur Radio Equipment (47 USC 97.305)
47.00 ghz - 47.20 ghz 6.0mm Amateur Radio Equipment (47 USC 97.305)

SS Amateur Radio Bands Rarely used for eavesdropping (very expensive)
75.50 ghz - 81.00 ghz 4.0mm Amateur Radio Equipment (47 USC 97.305)
119.98 ghz - 120.02 ghz 2.5mm Amateur Radio Equipment (47 USC 97.305)
142.00 ghz - 149.00 ghz 2.0mm Amateur Radio Equipment (47 USC 97.305)
241.00 ghz - 250.00 ghz 1.0mm Amateur Radio Equipment (47 USC 97.305)
300.00 ghz - Light (3 Thz) Amateur Radio Equipment (47 USC 97.305)

Note: Most commmon spread spectrum/hopping bugging equipment will hop at speeds between 100 and 50,000 hops per second. Equipment is readily available that hops even faster (100,000 to 300,000 hops per second). Dwell times can be as small as 1us (one widely used military system uses a dwell time of 3-5us)

Outband Equipment
ANY Television broadcast or Cable TV frequency
ANY FM radio broadcast frequency
ANY Paging or Beeper frequency
ANY Cellular Telephone frequency

820 mhz - 960 mhz Modified (902-928) Cordless Telephones
Modified Amateur Radio Equipment (can be on ANY frequency)

Keep in mind that wideband (non-ISM) Spread Spectrum/Hopping Bugs are very difficult to detect(even if you are within a few feet). Watch for carrier feed-through, and "Noise Floor Humps".

All Spread Spectrum devices are detectable

Once Spread Spectrum/Hopping Bugs have been located (on the RF spectrum) all that can be done is to locate the sourse of the emission... it is virtually impossible to demodulate a SS signal unless you have access to the key.

Also, a 500mw ISM device can easily have an effective range of over 20 miles.

Look for spectral anomalies (humps) on the Spectrum Analyzer, and back up with a Compressive receiver.

Note: In the early 80's I spent considerable time working with diplomatic spread spectrum bugging devices operating on frequencies between 20ghz and 56 ghz, using a 3ghz window.

Band Width Resolution and Filters
Examine the spectrum with the following BW resolutions/filters:

Source record: 232809

(Continued from previous message)

Utilize all BW resolutions/filters between 5hz - 200mhz (depending on band being checked)

For frequencies between 9khz and 7ghz I generally prefer to start with a 3mhz IFBW for a "moving" sweep, and to monitor the (wideband spectragram). This makes the energy easy to spot, but tough to identify. The IFBW is then modified until it is roughly 85% of the signal bandwidth, the results are then sent through a vector analyser for identification.

All IFBWs available on the analyser are also cycled through and the results overlayed into a matrix, a little vector analysis is applied, and the channel parameters are easily extracted.

To handle the microwave bands IFBWs between 10khz and 200mhz should be used.

Real World Example:
Frequency Hopping bug, randomly hops between 630mhz and 700mhz, a IFBW of 70mhz will allow the activity to be easily identified, but a narrower IFBW will make it much more difficult.

Hint: A programmable digital spectrum analyzer should be used!
(1/3/5/10/15/20/25/30/50/75/100/150/200... Sequence is prefered)

MilAir
>frequencies in the area to keep me busy?

Howdy, Matt!!

I might be across the street from you, by your description. To
answer your question, try the Comm Center BBS, local to you,
(719)392-8723 and check the file section. Lots of HF and VHF+ stuff
of local, regional and national interest. I keep a list there,
should be something like CS_FRQ51.ZIP of the frequencies I listen to.

For a start, try 133.150 and 134.50 for all kinds of choppers
transiting Butts AAF (Ft. Carson) and it's gun range; and 372.20 for
Peterson Dispatch, in/outbound heavies with other than routine
traffic.

As a guy who write these books, I think it is fine to ask about specific freqs and areas on the Net. I try and answer the ones in my field of expertise, and have had good results when I have asked about areas I visit. Why should someone spend $30.00 for my book, when he wants to get ahold of a specific freq? I have no problem with that. If I can't answer the question, then I know I have some work to do.

Rich Carlson, N9JIG (ScannerMaster Illinois Communications Guide, Monitor America IL state editor)

In article <4@ibbs.av.org>, js@ibbs.av.org (Jeff Stillinger) wrote:

** I am having a hard time understanding why there are so many posts
** asking for frequencies, for common places. Could anyone imagin what
** this group would be like if someone did post all of the frequencies
** asked for? Folks, at any one given time there are over 50 books
** published with more than enough frequencies in them to keep you busy
** for months. All of the answers you are looking for are in these
** books. There are even CDROM's out there now.
**
** Lets look at some of these message subjects and see.
**
** Olympic Frequencies - Been published in this group too many times
** already.
**
** Orange County, CA - Too many pages in police call to even worry about
** counting them all.
**
** CB Frequencies - Get real.
**
** Cordless Phones - Published everywhere, including manuals for the
** phones. Totally talked out in this group.
**
** SF Bay area/Yosemite Park - Published in both local and Fed freq books.
**
** Airlines - Published in so many places it is too funny to even ask
** about.
**
** Military Aircraft - Like the military aircraft use frequencies any
** different than any other airplane. Either way, published in two
** places I know of.
**
** Disneyland - As a lifetime pass holder, I have been hundreds of times
** and have yet had time to monitor rides. Riding the rides is much more
** fun. Besides having a scanner on while on a ride is like those morons

** who use flash photography and blind you in the ride.
**
** Buffalo NY
** Plantation, FL All of these big cities are not published anywhere.
** Austin, TX Yhea right! Too many trees have died for these.
** Simi Valley, CA
**
**
** Having a scanner without a frequency book is like having a scanner
** without a antenna. I have a small collection of books and CD's. I
** only have 10 books and 1 CD. Some people have 50 books and god knows
** how many CD's. These books are not that expensive. They are worth a
** whole lot more than $10.00 if you want to monitor something. Some get
** updated every year. Others every two. Some are local, and others
** cover all 50 states.
**
** If you are new to scanning here is what you NEED to do. Find a place
** that sells these books. CB radio shops, Ham radio stores, Radio
** Shack, and many others. Buy two books. One book should offer
** frequencies that are considered "local" to the area. So if you live
** in bumb f*ck nowhere, your local book should cover bumb f*ck nowhere.
**
** The other book should cover the United States. These types of books
** should cover state and federal agencies, and some big cities. Broken
** down into a listing by state. Using this resource when you traval you
** will have somewhere to start. When you get to where you are going,
** you can then get a local book for that area. Think of it as buying
** maps when you drive accross the country.
**
** The next step is to USE THE BOOK!
**
**
** Thats all. It should be fun reading all of the replies.
**
**

4436. Standard's "CT508-A" And Cellular

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: RLS <shenb@ix.netcom.com>
Message-ID: <31AD0ADC.3EC1@ix.netcom.com>
Source record: 232814

Just picked up a great little shirt pocket "HT" at the Dayton Hamvention and I'm very impressed with the receive capabilities. Dual-Band Transmit - 60 memory channels and it receives 110-190 mhz (am for air band), 320-400 mhz, 400-500 mhz and 700-980 mhz. The cellular areas are blanked out from 823-850 mhz and 868-896 mhz and not modifiable acording to Standard's technical advisors at the Hamvention because the acess lock is burned into the cpu controller. The way around that hurtle is very simple. Multiply the 1st IF freq (23.05 mhz) X 2 and you get 46.1 mhz. I simply added that number in my head to 868 mhz and came up with 914.1 - start listening from 914 mhz thru 943 mhz and you hear the entire cellular band. Sensetivity is very good as the receiver is very hot and not bothered by any intermod that I could detect. While the transmit power is tiny (300 mw on 2 AA penlight batterries) it is stingy with the batteries. I am yet to change the first set of batteries installed at Dayton.

Great Radio! much improved over the CT-108-A and Dual-Band Transmit to boot

4437. National Scanning Convention Cancelled

Newsgroup: rec.radio.scanner

To: All
From: Larry Miller
Re: The National Scanning Convention
Date: 28 May 1996

After much consultation with people in all areas of our industry, I am regretfully announcing the cancellation of our annual convention. This brings to an end a popular radio event that had it roots almost a decade ago in the now-defunct North East Scanning News summer get-togethers.

In the end, the success of any convention is dependent on the level of interest expressed by its participants. This year, it became clear almost from the start that we did not have the support of the industry, much of which is in a crash of historic proportion. Putting on a show of this magnitude was simply not something we could do alone and so we have decided to put the idea of a scanning convention on ice for now.

At a time when even the Dayton Hamvention, the largest event of its kind in the northern hemisphere, saw significantly lower attandance figures -- not to mention sales that one observer described as "profoundly depressed" -- it was not surprising that interest in a scanning convention would drop dramatically also. What was surprising, however, was how quickly interest dropped in the period between last yead this year's scheduled event.

And so, this is a very sad time for us. After all the fun of last year's show, we really looked forward to seeing everyone again and putting on a show that was even bigger and better than last year. We thank everyone who did register to come, to sell or to speak. If you sent us a check, your refund is already on its way.

We'll have more news as it becomes available. And I'm sure Joe Nooney will have something to say about all of this in the next issue of National Scanning but that's it for now.

I bought the HB-400 from Diamond Antennas. It attatches to any air vent in my Taurus and
the
scanner attatches to it via the belt clip. This device is shaped some what like an "L"
I also have one for my scout and they sit side by side. This arrangement helps keep
"heads up" while driving. Since this installation, I haven't rear-ended anyone.

First you need to buy the optional DS800 chip and install it.
The rest will be self explanatory. I believe the DS800 chip
is activated via the LOCAL key.

The book that I recommend is called ScanFan. It is focused on Southern California frequencies. I got mine from Henry Radio in Culver City for about $20 bucks. The arrangement in the book differs from all of the radio shack books. It is mostly arranged by city. A given city will include frequecies for Police and Fire. It will list the agency and channel description with the frequency. Way too much other good info in this book. Just get one and I bet you will be happy.

<snip, snip, snip>

This message was from kn4aq.gary@mms.net (Gary Pearce)

FCC Creates New CB on 460 MHz Band

by Gary Pearce KN4AQ

The FCC has created a new Citizens Band service in the 460 MHz band. It's called the Family Radio Service (FRS), and is designed to be an unlicensed, "Very Short Distance Two-way Voice Radio Service." The FCC Report and Order creating the service was released May 15th, and will become effective sometime in June (30 days after publication if the Federal Register).

The specifics:

FRS will permit handheld operation, with 1/2 watt ERP and "rubber-duck" type antennas only, on 14 frequencies in and around the GMRS radio service at 462 MHz. The exact frequencies are listed below.

No external antennas or amplifiers will be permitted.

To avoid interference with GMRS stations, FRS radios will be required to use only 2.5 kHz deviation, half the usual narrow-band FM deviation of 5 kHz. Transmit audio frequency response is limited to 3.125 kHz.

Frequency stability is tight as well -- transmitters must not drift more than plus or minus about 500 Hz (.00025%). You'll find typical ham radios on UHF up to 1000 Hz off frequency.

Subaudible tone and other selective calling methods are permitted.
Autopatch or other telephone interconnect is prohibited.

Antennas must be an integral part of the radio, and must be vertically
polarized. (I suppose that means you can't hold the radio sideways
while transmitting?)

FRS is an unlicensed service, and there are almost no restrictions on
the content of FRS communications.

The FRS channel frequencies are:

Channel No. (MHz)

1..... 462.5625
2..... 462.5875
3..... 462.6125
4..... 462.6375
5..... 462.6625
6..... 462.6875
7..... 462.7125
8..... 467.5625
9..... 467.5875
10..... 467.6125
11..... 467.6375
12..... 467.6625
13..... 467.6875
14..... 467.7125

Complete rules and comments from the FCC can be found on the FCC's Web
site, at:

http://www.fcc.gov/Bureaus/Wireless/Orders/fcc96215.txt

4443. CAA radio procedures (UK)

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: Neil Soane <nsoane@pavilion.co.uk>
Message-ID: <31AC974F.5E14@pavilion.co.uk>
Source record: 232821

I am a keen airband listener from home. At my local airport (London, Gatwick) we have four stacking areas directly over us and the calls they give are logical except for one part. When the pilot is handed over from the main airways control (south) at West Drayton they go to Gatwick approach director and the call would normally be structured like:

AC: "Gatwick director good morning/afternoon/evening this is Speedbird 4330, 260 knots towards Mayfield (VOR), we are a 737 with Zulu (or sometimes "information zulu")."

Now I understand everything here except the last part of the call, the phonetic often is different, but I have no idea what this "information zulu" or "zulu" or "pupa" actually is.

If anyone knows this would really help out, and stop me from pulling my hair out every time I hear it. None of the reference books on the subject make any reference to it.

Any help would be appreciated.

regards,

Neil

Any info on opening up the 800 mhz segment of the FT-50R yet?
Thanks in advance!

Only if they are DIGITAL will your conversation be anymore secure then
a normal phone.

P.S. There are 100Ch for the 900MHZ phones.

Last I read in their SKY magazine, you may listen while in flight, but not during takeoff or landing. You may not Transmit on a cell phone or a ham/commercial tranceiver while on the plane. They do have "airphones" for communication with the surface!

4448. Re: Scanner Books, Please read them...

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: hankbop@aol.com
Message-ID: <4ogost$fd2@newsbf02.news.aol.com>
Source record: 232847

Jeff says:
>>I am having a hard time understanding why there are so many posts asking for frequencies, for common places.<<
???

>>Folks, at any one given time there are over 50 books published with more than enough frequencies in them to keep you busy for months. All of the answers you are looking for are in these books. There are even CDROM's out there now.<<
Yeah, keeping you busy for months entering and deleting hundreds of frequencies that may or may not work. Most seem outdated and the freqs sometimes incorrect. But at least they're good starting points. Why not ask here online for current info? This is rec.radio.scanner after all. Modern communications, etc, etc, blah, blah blah...

>>So if you live in bumb f*ck nowhere, your local book should cover bumb f*ck nowhere.<<
Definately NOT true, even if you live in bumb f*ck somewhere...

>>The other book should cover the United States. These types of books should cover state and federal agencies, and some big cities. Broken down into a listing by state. Using this resource when you traval you will have somewhere to start. When you get to where you are going, you can then get a local book for that area. Think of it as buying maps when you drive accross the country.<<
At least I agree somewhat there. But there's nothing like asking the locals for their expert insight.

I don't think there's anything wrong in asking for common/uncommon freqs in this newsgroup. Why shell out $15 or $30+ for a book/CD that may or may not have the correct freqs to monitor? Shit happens, things change, so do frequencies. Nothing wrong with asking. Newsgroups are the closest thing aside direct communication to getting more info. Take advantage of it. Sure it's redundant or boring to read or scroll past constant postings about things that could be covered in a faqs or a book but what's the big deal? Besides, there might be a revelation in the post that'll let you enjoy this hobby even more.

Just my 2 cents...
- Henry

4449. AR-8000 (

JD>--hi, i was looking at the spec sheet for an AR-8000 and was very confused
JD>by the following terms......USB, LSB & CW
JD> what are they? and why don't most other scanners deal with them?

USB = upper side band
LSB = lower side band
CW = carrier wave
There are used to receive military and ham signals.
The AR8K goes down to 100 Khz and can receive in the above modes plus
AM, NFM (narrow band FM) and WFM (wide band FM). Thus it can receive
shortwave, aircraft, and TV audio. [Not all scanners can receive military
air, i.e. the 200MHZ band).

JD>and also....

JD>i heard that the Ar-8000 has built in "decoders" for phone tones, morse
JD>code, pagers, and other "coded" text messages...and displays all text to
JD>the (built in) screen...sounds a little TO GOOD to be true....can some one
JD>straighten me out about this!! and if possible, explain the "bonus" USB-
JD>LSB and CW stuff.

No decoders for DTMF, pagers, etc. The only option is the DS8000 that
allows voice frequency inverters to be decoded. The inverters are
used by some law enforcement and some corless phones. This is not
what the FBI or SS uses.

DC>Let's get the discussion going....<g>

DC>Dave Cripps

What good is a 1000 channel scanner without alpha-tags? Thus ignore
the Yupi. The 8000 can be loaded from a PC with a bit of pain. The
Yupi has no data port. Thus, forget the yupi.

The 8000 is not a mini-3000. The 3000 scans faster and has no intermod
problems. If you have a computer and listen at home, use the 3000A. If
you like to take it with you, buy the 8000. If you have the bucks, buy
them both! The 8000 will be burdened with pager intermod at times. I wish
these damn Earth First wacos would give up tree spiking and start going
after 1000 watt pagers at full deviation.

Eric Hansen (ehansen@ix.netcom.com) wrote:
: I'm going to several air shows this summer. Do they use separate freqs.?

: TIA

Each geographic location (airport etc.) will have it's own assigned freqs
for tower, approach/departure etc. Show platform freqs that control the
performance area may change and solo performers (barnstormers etc.) will
stay on these. Group performers usually have their own channels that they
use routinely to coordinate (Thunderbirds/Blue Angels/Lima Lima).

4453. MX 7000 wideband FM IF sample point?

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: corrigad@televar.com
Message-ID: <4ogokc$3mr@golden.ncw.net>
Source record: 232852

Hello, anyone happen to have a schematic handy for a Regency MX 7000 that can tell me a handy spot to tap into the wideband FM IF? I am trying to use an Icom 751 to monitor the IF to demodulate the SSB signals on VHF-Mostlly 6 meters. The 455Khz IF works great, just too narrow to move the Icoms VFO around more than 10Khz on each side of the IF center. Seems like the wideband IF would be alot better for this purpose. I have a circuit for sampling the IF without loading it down that is good to +25Mhz. Anyways, I brought the IF out thru the back of the scanner with an RCA jack and it works pretty decent.
Anyone give me a hand?
Thanks very much for reading!
-Dave

>There are NO uhf "cb" freqs...what you are thinking of is what is now the
>"GMRS" band, which unlike the "CB" band, DO require an FCC license.
>The GMRS bans is at 462 mhz.

GMRS is a lot like CB of the old days. The license covers everyone in the household. GMRS is intended to be used as the old Citizen Band was, for short range personal communication. One difference is that repeaters are allowed. Another difference is that you are licensed for only one or two "50 watt" frequencies. This doesn't seem to be much of a problem because very few people use that band, in my area anyway. This may change when the new family band arrives in June. These less than half watt units will not require a license to operate on all of the current splinter frequencies plus seven more "new" splinter frequencies 5 MHz above the current splinters. These low power units won't have an impact on the high power frequencies. There was some worry that they might get into the repeaters but that is almost impossible.

Mike

4455. RS2004 vs RS2035

Source record: 232854

I have a mint condition 2004 with speed, memory, and cell mods that I use for my primary base scanner. I was thinking about replacing it with a RS 2035 I can get on clearance at the local RS Outlet store. I was considering it primarily for the 1000 channel capability and the fast scanning rate. I know that you can do a keypad entry for the cell bands. Does anyone have any opinions about such a switch. Pro or Con, all opinions are welcome. Thanks, Monty

I'm looking for frequencies used in Military air shows. I have a
military air band reciever and am primarily concerned with the upcoming
show at Grissom Air Reserve Base in North Central Indiana. The aircraft
included in the show include:

C-5 Galaxy
C-141 Starliner
C-130 Hercules
KC-Extender
KC-135 Stratotanker
E-3 Sentry
F-16 Fighting Falcon
A-10 Thunderbolt II
T-38 Talon
AV8 Harrier Jump Jet
F-18 Hornet
UH-60 Blackhawk
UH-1 Huey
AH-64 Apache

Any information including frequencies and URLs with related info
would be greatly appriciated. I have searched to no avail tonight with
alta vista. Please respond to n9xlt@holli.com or if you think this
would be of benefit to others please post in this group.

Thanks,
David A. Wallace

That is true. I have an AT&T 9100. I am able to get the scanner to lock on it,
however, all you hear is a satisfying sssssssss. The signal is also very
difficult to "lock". It can be done, but only in seek mode. If you were any
farther away, I doubt you could get a scanner to lock on, without a 900Mhz
beam antenna.

Ban the word ban.

You must understand Hurricaine season in Florida (many, many watches)! You are right about the need for a radio that discriminates (or alarm frequency) between a warning and a watch... However, until someone dreams up that system, I'd like to be able to control the alert volume!

: WILLIAM PULVERMACHER Fishn_Magician@prodigy.com

William,

I bought a Comet SH-55 antenna for around $29. It is a 16" whip.
I used this to replace my standard rubber-duck on one of my radios. It's
performance has been pretty good. It has something like 3db gain on VHF
and 4db gain on UHF. I use my radio on VHF-HI, UHF, cellular, and 900 mhz.
I noticed a definite improvement switching to the antenna. I've also
heard the Austin Condor's are nice too.

No need for sarcasm! I have my pro-2006/os-456 set up to scan the upper ranges of the cell phone frequencies, but only because there are some other services mixed in there. Listening to cell phone conversations are about as exciting as watching the grass grow, and in fact they get in the way of monitoring these other services.

>--
>(DAVID MARK) dg715@cleveland.freenet.edu

I beg to differ. The term "shortwave" in itself has no meaning other
than a band of frequencies ABOVE the broadcast frequencies. This
would seem to include the so-called "scanner" frequencies. You can
scan the shortwave frequencies as easily as the VHF and above freqs.
The only real problem is the mode of transmission. While the VHF and
above freqs are generally FM, the frequencies below about 10 meters
are generally either AM or SSB. This is what would make it
unfeasable to "scan" them. BTW, everything from DC to light is in the
SAME electromagnetic spectrum.

>Does anyone have any opinions about such a switch. Pro or Con, all
>opinions are welcome. Thanks, Monty

Opinions are like belly buttons. Every body has one. Heres mine. I have a PRO-2006/OS-456 that I wouldn't trade for ANYTHING !! On the other hand, if you have a radio with 52,500 channels. . . . . How can you listen to them all at the same time?? While scanning on channel 5, for an example, action is taking place on channel 1536. By the time the scanner gets there, it's all over. You will miss more than you hear.

IF, on the other hand, you have two or more scanners, then the likelyhood of missing the action will be less. In addition to my 2006, I also have a pro-2030 running. What I do is program a SET of sample freqs in the 2030. ie; fire, police, aircraft, etc. When I hear that there is action on say, the fire channels, then I switch to the computer controlled 2006 with all the freqs in that service. In the mean time I can still hear all the related stuff going on, on the 2030.

IMHO, it ain't the number of channels you got! It's the quality of the machine. My advise to you would to be save your money, get the Optoscan 456 for your 2004, anf then get a cheaper scanner to run alongside it.

4468. What features would you want in a AR8000 software program

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: phares01@internext.com
Message-ID: <4ok75f$d1g@sonoma.internext.com>
Source record: 232867

I am currently writing an AR8000 program, so far It has memory -
upload/download/edit/sort/save/open and search bank - upload/download/edit.

Do alot of people use software for actual scanning?

I use software mainly for memory editing, etc...

This is meant to be a simply utility, not a SCANCAT (c) replacment.

What other "must have" features do some of you fellow scanners need?

I might be ready for some beta testing in a couple of weeks.

The program is written in VB4, currently requires 1024x768, has only been
tested using an AR8000INF interface and of course an AOR8000 scanner.

email me with your reply.

Wayne.

>great skyhooks.....
>ron
>wb6gki

Great idea. You can also go to almost any public library and get a copy of the ARRL HANDBOOK off the shelf and look for 6 Meter beam antennas (50~54MHz)... photocopy as required.

Select a Beam with at least three or more elements, where more elements = more GAIN and the more directional the antenna becomes .

Examples of active (fed) element lengths are * :
at 40MHz, the length is 5.85'
at 45MHz, the length is 5.2'
at 50MHz, the length is 4.68'
*To calculate for a SPECIFIC frequency, divide your desired frequency into 234.

The Poverty Approach would be a TV antenna, fed with 75 ohm coax, with mucho elements mounted VERTICALLY on a mast with a 'armstrong' rotor (window open, mast just within reach ~ twist for best signal).

One thing though. If your serious about listening to cellular (legally, or otherwise), keep in mind that the AR8000 has a problem due to its third (455Khz) IF filter being VERY narrow. Often, cellphone calls have a problem where there are frequent "dropuouts" in the signal. Cellular signals are wider than normal NFM signals. The cure for this is to replace the IF filter with a wider one. This will slightly reduce adjacent channel selectivity on other signals, probably the biggest drawback of doing this is that AM shortwave performance will be ruined. The fix takes a fair amount of electronics skill, and shops charge upwards of $150 to replace the filter for you.

t the 300 mhz band?

What you are hearing in cellular "images". An image is where you hear a frequency other than the one you are tuned to. Images are usually about 20Mhz from the tuned frequency, or can be a few hundred Mhz above it, depending on the receiver. Cellular signals are quite strong and have the ability to get received elsewhere on the "dial" quite easily.

In fact, most scanners sold in the US which are cellular "blocked" have the capability to receive cellular as an image somewhere else. In many cases the reception is quite clear.

>opinions are welcome. Thanks, Monty

Monty,
Don not replace the 2004!!! A well modified 2004 will run circles
around many of the new radios out there now. In regards to the 2035,
the biggest performance difference between both radios is when
listening to weak signals in the presence of a strong station
transmitting on another frequency. The 2004 has much better dynamic
range than the 2035, it produces a kind of a hiss 100khz away.
The only things that the 2035 has over the 2004 are the following:
1) Scanning speed 50 ch/sec (but you can boast the 2004 up to 30
ch/sec by changing the stock crystal to a 9-10Mhz one).
2) 1000 memories out of the box (you can get 6,400 for the 2004 from a
mod)
3) Search and Store.....which Monitoring Times bashed during their
review and now we have the 2042 (there was mail order co that made a
module for the 2004/5/6 that would do the same...wonder if they are
still around thou)
4) Add an Optolelectronics Board for computer control (there are
several out there for 2004 but not as slick :~<)
5)A VFO knob (Well... there is no mod for this one...I almost never
use it on my 2035!)

Hands down...if you have a well hacked 2004 (modified) like I do
(every Bill Cheek mod done..except for the silly ones that have no
performance value) then you will have a hard time finding a
replacement for it, unless you get a ICOM-9000 ($4-5,000). With it's
metal case and tacticle front panel..you are ready for just about
anything. DON'T LET IT GO.....

If you are talking about spread spectrum, yes. However there are only fiftysomething channels avaialable for narrowband phones on 900. Direct sequence phones get more "channels" because of their CDMA properties.

>"Tomas W. Lesik" <tomco@cyberspc.mb.ca> wrote:

>>jeff wright wrote:
>>> Does anyone know just how secure these new phones are? I haven't yet
>>> tried to see if my scanner will pick it up...

The Escorts are quite secure. You won't pick them up on your scanner. The direct sequence SS method essentially "encrypts" the the data (its digital) twice.

The signal is about 5 MHz wide! And the base and handset do not transmit simlutaniously - they use TDMA for the full duplex effect. Very digital and very spread.

Of course the "encryption" can be cracked. But it would require a very sharp hacker with some very high end radio gear and a good computer to do it. It's just too hard to do from a practical standpoint... I subscribe to the idea that it would be more effective, and actually a lot easier, to just tap a phone line physically if someone is that bent on eavesdropping.

>>I haven't had any problem picking them up, in fact the reception is alot
>>clearer then some Cell's...

I seriously doubt you have picked up any of the Escort Couriers on your scanner. If you are hearing 900 Mhz cordless phones, they must be analog narrowband.

4484. LASO Simulcasting? What's the deal on freqs?

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: conrad@deltanet.com
Message-ID: <conrad-2905961103070001@news.deltanet.com>
Source record: 232883

Fellow scanner listeners (especially those in Los Angeles County, CA):

When monitoring the LA County Sheriffs, I'm frustrated by my inability to target particular dispatch areas or stations. Although the freq lists and books I have do associate each frequency with a station (e.g., Lennox or West Hollywood or Century), the dispatch is sometimes from way across town. I hear East L.A. being dispatched on West Hollywood, for example, and I hear Lancaster calls apparently going out on Lennox frequency.

Obviously, what I want to do is put in a couple of the most appropriate LASO dispatch channels in each of the scan banks I have for various geographical areas of Southern CA, but this doesn't seem practical since I can't predict what calls will be dispatched on what freq.

Does the LASO simulcast their calls over a wide area? Or, do they shuffle frequencies around for their dispatch channels a lot? Anyone know what's going on here?

Thanks! :-)

Conrad

From: 73573.1504@compuserve.com
Message-ID: <4oi4kp$k8@nntpa.cb.att.com>
Source record: 232884
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner,alt.radio.scanner

I took my radio to the Indy 500 race this weekend and used it to access the Indianapolis repeater as well as using it as a scanner to listen to the pit crew/driver communications, race control, and broadcasters. Some of the things that I really liked about using the radio as a scanner are adequate scan speed, great audio, alphanumics to identify the channels, the ability to program the radio with the computer and save the information in a file, and the small size compared to a conventional scanner.

However, in an EMI hostile environment like a race track, I experienced a lot of interference from IMD's , bleedthrough etc. Most of the signals at the track are very strong (I was able to pick up a perfect signal from the track safety crews when I was 2 miles away from the track). My Bearcat 200XLT did not experience interference as badly as my FT-50 and my brother-in-laws Realistic scanner did not experience any interference (not sure of the model number, may have been a triple conversion scanner). A friend suggested that the next time that I take the radio to a race to take along a collection of SMA inline attenuators to put between the antenna and the receiver. I believe that this will solve the problem.

By the way, this would have been a perfect situation to utilize the advertised Wide FM receive that is advertised. I try to take along as little stuff as possible to the race and it is sometimes helpful to listen to the FM broadcast to keep track of the race. The other bug that I have found with the radio is that the receive icon in the LCD display does not come on when a signal is received. The instruction manual states that one can turn off the LED to save the battery and the icon will perform the same function, but it does not. I realize that this is a small complaint.

Overall, I am very pleased with the radio.

4487. POCSAG Paging Decoder 2.01 Released

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: Pete Baston <pete@bearnet.demon.co.uk>
Message-ID: <N0pHCIAk5JrxEwXc@bearnet.demon.co.uk>
Source record: 232886
Cross-posted to: alt.radio.scanner.uk,alt.radio.scanner,rec.radio.scanner

```
PD (POCSAG Decoder) Version 2.01
--------------------------------

**** Announcing the release of PD version 2.01 ****

PD is an MS-DOS program for decoding POCSAG paging transmissions on an IBM
PC or equivalent, 80286 processor or later.

PD requires a simple interface between the audio output of a scanner or
receiver and a COM port on the PC. This is described in the documentation
file.

VERSION 2.01 May 1996

* Minor bugs fixed, screen colours and restoring cursor.
* PAUSE now works while in DEBUG mode.
* Serial output of messages on second serial port now supported.
* Added support for Swedish and Danish language characters.

PD is distributed as shareware. The shareware version has a 5 - minute
timeout and does not log to disk, or output messages serially. Upgrade to
the full version is by a key file available from the author on
registration, which costs 20 Pounds Sterling.

Registered users of PD 2.00 may unlock version 2.01 using their existing
.KEY file.

PD 2.01 may be downloaded from the following sites:-

ftp://ftp.demon.co.uk/pub/ham/scanners/pd-201.zip

http://www.keplens.co.uk/pager/

Conrad:

While I do not in any way speak for the Los Angeles County Sheriff's Department, possibly I can offer some insight.

Before I joined the world's best Fire Department <grin>, I was a Dispatcher for LASD. While **much has likely changed** since my days at the Sheriff's Radio Center (SRC), they at that time used a rather interesting "trunking" set-up for their Dispatch consoles. No...it's not what you're thinking of.

Have you ever noticed how the LASD never seems to have the same dispatcher's voice pop up on a given frequency?

There are more frequencies than Dispatchers. For routine comm's, the channels are not assigned to a given console. As soon as the squelch breaks, the audio opens up on the first available console (along with all the CAD and records data). When the routine comms are completed, the dispatcher presses a release button and the frequency then returns to cyberspace. If there is a hot call, for continuity sake, the Dispatcher does not release the frequency.

What you are hearing is when a frequency "lands on a console" before the Dispatcher has had a chance to select and release another frequency they were handling. You then have a multi-cast over those briefly paired frequencies. Once the Dispatcher figures out which frequency to release, they dump the "routine" traffic channel and continue. If it's really a hotshot they can take themselves out of que to "solo" a frequency at their console.

Again, that **was** the way it worked during my tenure at LASD. The folks there do a truly outstanding job.

For authoritative info on how it currently works, I kindly suggest you contact my good friends at LASD directly.

Monitor Safely!

Yeah, it would be pretty similar to what the hams use on the 6-meter
band. Very big, very ugly, and a whole lot of work to put up.

4491. Can anyone answer these questions?

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: "David L. Haas" <dhaas@uncfsu.campus.mci.net>
Message-ID: <31ACB33D.4F2F@uncfsu.campus.mci.net>
Source record: 232890

How much difference is there between a base/moble and a base scanner other than one can go AC - DC. Are the guts essentially the same for comparable units? Can you connect external antennas to both? Is the price much less for a base only unit? If it isn't why would anyone want a base only model? Any comments?

Thanx in advanz for your wisdom.

D. Haas

4492. Houston, TX background music freqs

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: slwork@netcom.com
Message-ID: <slworkDs6Lny.2ut@netcom.com>
Source record: 232891
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I was noticing the other day that a lot of the establishments (i.e. restaurants) in Houston, TX have unusual looking antennas on their rooves. Most certainly these are for a background music system, very likely Muzak. While typically these installations have an FM broadcast yagi for receiving FM-SCA broadcasts, the ones in Houston have something which looks sort of like a radio station STL (studio-transmitter link). Seem like this would be tuned to somewhere in the UHF band, perhaps around 900 Mhz. A few of them had very small yagis on the roof.

I tried scanning all the way up to 1900Mhz with wide FM and came up with absolutely nothing, however. I paid special attention to the areas around 920-932 and 956-960 since I know that these freqs are used for background music in some cities like Atlanta and San Francisco.

Does anyone know what frequencies this system might be operating on? Might it be using some form of digital modulation? Also, I was trying to search the on-line Percon CD and could not figure out the 2-letter broadcast service code which is used for background music (multi-point) services which operate on 928 and 956. Does anyone know what the 2-letter code for this is?

4493. Re: F.S.R. UHF- CB Freqs " N E W " !!!

A couple of points: the correct name is FRS - Family Radio Service,
it is not C.B. (power & modulation are different and the hardware specs
are significantly tighter), and the freqs posted for Chs 8-14 were wrong.

From the FAF - Frequently Asked Frequencies (to be updated
on CompuServe - Hamnet as FAF.TXT on 01 June 96)

FRS - Family Radio Service [95.627]

Ch Freq Ch Freq

1 462.5625 8 467.5625
2 462.5875 9 467.5875
3 462.6125 10 467.6125
4 462.6375 11 467.6375
5 462.6625 12 467.6625
6 462.6875 13 467.6875
7 462.7125 14 467.7125

The FRS was adopted on 10 May 96 and will be authorized
by July 96. It uses FM with a peak deviation of +/- 2.5 kHz.
Maximum power is 0.5w.
Channels 1 - 7 are shared with GMRS.

4495. Radio Shack Outlet w/ Modifiable Pro-2026

Newsgroup: rec.radio.scanner
Date: 1996-05-29 00:00:00 UTC
From: rap@hooked.net
Message-ID: <31ab9211.10119698@news.hooked.net>
Source record: 232936

Having read a couple of posts about finding modifiable old stock at Radio Shack, I thought about one of the local RS stores that is designated an 'outlet'; it sells 'refurbished' RS stuff at a good discount with a 30-day warranty.

I dropped by last night, and lo and behold, there was a Pro 2026 with a date code of 11A3 (which someone had mentioned was a good one to get), so I bought it for $150, half-expecting to find the old innards replaced with a more recent system board. But no! There was a clippable L201 jumper, and I'm once again in Fat (cellular) City for the first time since my good ol' Pro 2004 crapped out a while back.

I suppose every big city must have an 'outlet' Radio Shack; a quick check may really pay off. Good luck!

A couple other weather radio feature that would be nice:

Be able to selectively program your radio to not necessaraly wake up (and wake you up) for "watches"--only wake up for "warnings". Take this a step further so that you can program your radio to not watch you for watches during certain hours.

Be able to selectively program your rado so that you aren't disturbed by watches or warnings in counties other than your own.

With the availability of digital radio signals, the above wish list should be something that NOAA and radio manufactures should be able to pull off fairly easily.

> Have a FT-50r and it does a good job as a scanner. Some of the
>features I like:
>- scans at 45 channels per second (according to Yaesu at Dayton)
> ....

I like the FT50R, too, but mine scans much more slowly.
It scans memories at 10 channels per second, under
these conditions:

18 channels in scan list
6 of those channels had CTCSS decoder bit set
1 channel had DCS decoder bit set
channels 1 - 23 programmed
5 channels with Skip bit set

I've measured the scan rates on several scanners and ham
radios and find that often

1) the scan rate is lower than the manufacturer's claims
2) the manufacturer's specifies an impractical
"maximum scan rate", instead of a typical scan rate.

Sheesh! Plainly and simply...shortwave refers to a radio band.
Scanner refers to a receiver designed to receive a multitude of
frequencies in various radio bands. You cannot compare the two...
it's apples and oranges. It's like trying to compare a pay phone
to an FM radio. One has nothing to do with the other.

Source record: 232644

Yes..as Uncle Bob says..solo performers have their own freqs for communication.
I suggest that you plug in the tower freq for thirport that the airshow is at.
I would also suggest that you try running your scanner in the search mode from
118.00 to 135.00 MHz AM. This should help you pick up any communications between
pilots and ground comms. If military performers are going to be present, then
you probably want to monitor 230 MHz and up. Good listening !!!

4504. Re: Dole Scanning Freq's?

I spent all day Sunday at the U.S. 500 nad my Pro-43 was on the whole day.
from about 12:00 noon until 7:30pm, after the race we waited in the parking
area listening to the helicopter traffic, and the Michigan State troopers.
In the scanner the whole time were a mixed set of old ni-cads. 4 G.E. and 2 of
the purple Radio Shack jobs. During the race the volume was set well above
halfway, and scanning the whole time. After the race the volume was turned
down, but still scanning. I'd say if you only get 2-2.5 hrs on fresh alkalines,
something is wrong.

>may not have the correct freqs to monitor? Shit happens, things change, so
>do frequencies. Nothing wrong with asking. Newsgroups are the closest
>thing aside direct communication to getting more info. Take advantage of
>it. Sure it's redundant or boring to read or scroll past constant postings
>about things that could be covered in a faqs or a book but what's the big
>deal? Besides, there might be a revelation in the post that'll let you
>enjoy this hobby even more.

Jeff,

Henry makes an excellent point. While we all know that there are lots of more effective ways to find lists of frequencies, it should not bother any of us to have to skip those postings which we do not wish to read. If bouncing your cursor over a few subject lines in your newsreader is getting to be an annoyance to you, you should reconsider your reasons for reading USENET news in the first place. This is how this particular resource functions.

One of the great features of this newsgroup is its activity level, and the sincere interest in assisting newcomers with all types of questions. Henry is most assuredly correct in stating that frequency data changes rather quickly. Input from other enthusiasts about frequency lists for specific areas is hard to come by from published lists, even on WWW, where data may sit for months between reviews.Posting to this group should continue to be encouraged by its reader/leadership.

Wouldn't it be interesting, Jeff, if tomorrow someone posts a request for freqs in YOUR area, and someone responds to it a few days later... You end up reading the response and...VIOLA! You find a new frequency for the local PD that you didn't know about? It could happen. To you or to someone else who reads the list. This is what USENET, and this group specifically, was created for.

Relax, and enjoy.
-Rob

Does this require a licence (eg is it basically a low power industrial
frequency) or is it licence exempt?

>
> Jeff

It already exists. Its just not being marketed or advertised very heavily. I called up the DOC (Now Industry Canada) and asked about such a service. The DOC has set aside 4 UHF frequencies in Canada for what they call personal or business LPI (low power industrial) frequencies. The radios are available at radio shack or you can set up your own (you still need to apply for a radio licence though). Power limited to 5w or less.

452.0625
452.3625
463.825
463.850

Other common low power Canadian frequencies are:

151.055
151.070
151.085
151.115
151.580
451.1875
451.6625
451.7875
454.200
454.225

Lots of security, shopping malls, construction, etc on these freq's! Even heard private eye's once following someone!

Happy Scanning!

>Gerald M.

Actually, Gerald,

Last time I was using my scanner on an airliner (see multiple postings on "Airline Scanner Rules"), I was surprised to hear our captain arrange to refuel an entire squadron of Navy Blue Angels (see all the requests for "Blue Angels Freqs") as we crossed over a summer air show (RE: Need freqs for air show this weekend). Apparently the old 727 I was in was a surplus KC-135 or something. I felt a "thunk" as the probe found the receptacle of the little fighter on our tail...

The most amazing thing of all was that the airliner and the Blue Angels all used cellular phones (see threads on "Is cell monitoring legal", "need cell phone freqs", and "mods for PRO-12 to get cell", etc. etc.).

Perhaps this must explain why their are NO aircraft band scanners.
Since aircraft use AM, they can't be scanned!

> BTW, everything from DC to light is in the SAME electromagnetic
>spectrum.

If we really want to be this picky, it's everything from AC to light
that is in the same spectrum.

Hello all.

About 1.5-2 years ago australia hosted a Large international air show which was quite good and they plan to have another at the start of 1997. This time with the Stealth Bomber aswell as the Russian fighters again (SU-27). Should be very good.

Anyway i captured an assortment of freqs at the last one which i have stored in my 8k and i was wondering if anyone else went and also got some freqs we could share in preperation to the next show in 97.

Catch ya,

4519. Midnight Engineering

Newsgroup: rec.radio.scanner
Date: 1996-05-30 00:00:00 UTC
From: sf3362@cnsvax.albany.edu
Message-ID: <4oj8b5$7bt@rebecca.albany.edu>
Source record: 232660

Hi!
Midnight Engineering offers many different products and services.
Most recently, our product line has expanded into the cellular phone
region , and I think that the readers of r.r.s might be interested in
what we have to offer.

Motorola Cellular Modems:

These are ORIGINAL Motorola cellular fone modems, which run at 14.4
Kbaud, data and fax, and have MNP1-5 and LAPM (Error correction and
compression) for throughput to 19.2Kbaud.
The modem is new, in original Motorola packaging (the software and
manuals are still in their shrink wrapping).
The modem comes with software for dos and windows, modem user's manual,
quick reference, and software manuals, a leather case with the Motorola
logo and name pressed into the leather, software on disk, and all cables
necessary to use the modem.
Cables included:
Phone line cable
Motorola Flip Fone interface cable
12 Vdc car adapter

The modem runs off of a 9 volt battery, and a new Duracell battery is
included with each modem. Alternatley, the unit can be powered with the
included cigarette lighter adapter.

The modem has a regular rj-11 jack, if you want to use the modem as your
home's desktop modem, too, running off of your regular phone line. You
can then disconnect it from your desktop, and connect it to your flip
fone and laptop for a complete portable data/fax workstation.

The modem has 6 status LED's for call progress indication.

I don't know how much Motorola originally sold these modems for, but I
would assume they went for several hundred dollars.
Our price is only $175.00!!
This price includes shiping/packaging.
COD $7 extra (that's what the local shipping outlet charges :)
At this price, these modems are going fast!

Also, Midnight Engineering is proud to introduce another product for your
mobile office. We are offering a 4 Watt mobile (12 volt DC) celluar
telephone amp. This item is great for handheld phone users, whose power
output is typically 1/3 of a watt. This RF amplifier will allow you to
use an external antenna (for better reception) and boost your power to a
full 4 watts (for better transmission). One customer of ours who hails

from a small island near Puerto Rico (where there is no wire
line telephone service) has written to tell us that this amp saves him
hundreds of dollars a month on his cellular phone, since he has attached
a directional antenna and pointed it at his home system's antenna site.
Previously, he was paying outrageous roaming costs because he was
"roaming" into a site on a nearby island.
For those of you with more regular situations, you will notice better
reception, better coverage and less "drop-outs".
The amp comes with a users manual, and uses two female TNC connectors
for connection to your handheld phone, and your external antenna.
The amp can be set for several different wattage levels, up to 4 watts.

Midnight engineering has been offering cellular/computer/radio parts and
services since 1986, and our customers are always satisfied.
This is just a small sample of what we offer.
Email us for information on other products such as:
Assembled POCSAG pager decoders
Assembled Ham radio data demodulators
Universal portable phone handsfree kits for autos (a steal at $115.00!
Works with any handheld cell fone, allowing you to talk and listen to
your party without holding the phone)
Custom projects
CB modifications
Cellular phone reprogramming cables
Surveillance equipment

Email us at:
sf3362@cnsvax.albany.edu
To reach Kevin, our internet order-taker
Thanks for your time.

Keith A Monahan (kamst39+@pitt.edu) wrote:

: What exactly is the 'coin-drop' period you are referring to? A
: customer can drop a coin ANYTIME during a phone call, and the mic certainly
: isn't muted all the time. On *SOME* new phones, whenever ACTS comes on,
: the mic *is* muted. The only fraud this would prevent would be the initial
: charge. And it's possible to surpass that charge by placing your call through
: the operator. As long as you kept simulating a coin-drop before ACTS came on,
: mic would never be muted. The majority of new phones being installed in the
: Bell-Atlantic region do not have the muting 'feature'.

This stuff, "red-boxing", is discussed to death in alt.2600. If you've
read that group, you will learn that you normally have to initiate the
call by putting in a real quarter, then dial a long-distance number.
After the long-distance provider asks you to deposit money, you make
deposit your "coins" with the tone generator. If an operator comes on
and says something like "can you do this again", or "how about putting
in some REAL money", you hang up the phone and get out of the place.

Why anyone would spend $50 or so to build a box which saves them a few
quarters at time so they can commit a juvenile, low-tech fraud like this
is beyond me.

: I have a PRO-2026 and It has a code of 11A2. Whats a L201 jumper? and what
: happens when you cut it. Is the one I have capable of picking up more
: cellular frequencies?

You open up the radio, cut the jumper labeled L201 on the circuit board,
and this will enable ALL of the cellular frequencies. These range from
824-849, and 869-894. These are the true frequencies that cellphones
operate on.

If you've already been listening to cellphones, you've been probably
listening to frequencies other than the above. What is happening is that
you are receiving "images", where the radio receives a strong signal
which is on a frequency to which it is not tuned directly. Listening to
the "true" cell frequencies will give you somewhat clearer reception.

The Dallas city police operates on a number of channels between 460 and
460.6, there is a lot of interesting traffic on these. Most of the
suburban police dept.s have trunked systems which are not to easy to
follow. Also try scanning 450-451 early in the morning, you'll get a
number of traffic helicopters and they sometimes say interesting things
when they aren't on the air (on the radio stations they work for, anyway).

4526. Numbers stations.....what are they?

Newsgroup: rec.radio.scanner
Date: 1996-05-30 00:00:00 UTC
From: Neil Soane <nsoane@pavilion.co.uk>
Message-ID: <31AE354C.63F5@pavilion.co.uk>
Source record: 232667

Does anyone have any thoughts on what are known as 'Numbers stations'? No-one seems to know where they are transmitted from and the fact that they are sent on unscrambled voice channels and in areas of the HF spectrum that are easily listened to, leads me to believe that they are not intended for subversive operations. What are they used for? Who would need such a simple code such as "Sierra Yankee Oscar two" or such like?

I can hear loads of these stations in the UK and most of them are transmitted on the standard AM bands with some on USB.

They come and go, they may transmit for an hour or so and then are gone, also they definitly pre-recorded or computer generated and are mostly in English, although I have heard some in German and Slovak languages.

The other anomaly is the single letter CW stations, these are the stations that continually send just a single letter of morse day in and day out. The frequency never changes and nor does the letter. Any thoughts?

I am sure that many people have asked this question and I would like to hear the thoughts from some of the knowlegable people on here.

Please either mail directly to me or onto the newsgroup, I thnk it would be interesting to see what people think.

Regards,

Neil

Hi Andy I"m a member of the press and a emergency services buff. I
somtimes monitor buffalo fire from accross the lake. I"d like to
add buffalo to my web page. So if your upto it why not post the
emergency services here and send me off a copy.

Even better, why not make a web page and others can link to you?

RGR. Have had one for some time. If you go to Wal-Mart and check in
the battery section, you can find AA lithium bateries! They have a much
longer life and much lighter! The total weight of the HT with lithium
batteries is 5 ounces!

I have a like new Radio Shack PRO-26 handheld scanner for sale. (limited use, 6 mo. old)I purchased the unit
new at Radio Shack. It has had the logic board changed which contained the US version CPU to a European version
board. This enables frequencies that are blocked out in the standard US models. (Includes cellular)

Freq. cov. 25-1300mhz (no gaps)
200 memory channels
fast 50 channels per sec. scan rate
fast search 100 or 300 steps per sec.
switchable AM FM WFM modes

Unit is in like new mint cond. complete with nicads / charger / manual. I do not have org. box however. Reason
for selling: Too many radios. (3 handhelds / 3 base) sheeeesh!!!

Asking $325 shipped to 48 states. Will take best offer.

E-mail if interested.

I don't recall ever hearing any commercial aircraft on any of the air refueling tracks in my area. Although I heard a Cessna making a run at the area bomb range once. Then an F-15C swooped in and toasted it with an AIM-7 Sparrow missle.

That will teach 'em to pop up on military frequencies. Adios Cessna.

PK>Thanks,

PK>PKH

No, the AR3000 does not have alpha, hence use it at home with
an outside antenna and control it with a computer. ScanStar keeps
a nice log of what was heard. [The computer noise will harm the
reception.]

My point was the AR3000 is a better radio (i.e. free from intermod and
still very sensitive) than the AR8000. There are spook organizations that
buy the AR3000A just for the RF boards and sell off the rest. If you
need a portable unit, buy the AR8K.

If somebody sounds like Donald Duck, they have a frequency
inverter in use. [I sure hope they know you Donald Duck is
in France!]

Frequency inversion uses two double side band mixers to reverse
the spectrum. That is, low frequency is now high frequency. It
is a cheap form of protecting what is being said. Low level
public safety organizations uses frequency inverters. In the
USA, the feds have DES encryption circuits. This type of
scrambling makes the voice sound like noise.

Hope that helps.

My search has been narrowed thanks to Fred and Mike so far.
Looking for military freqs for the following in the Charlotte, NC
area:

MOAs: Snowbird 1/2
Gamecock 1/A/B/C (have 287.10 so far)
Fort Bragg
Seymour-Johnson Echo
(Believe I have all of Bulldog)

AR-455, 328, 315, 203 (Have AR-600, 207, 216)

Also looking for air-to-air and Tac frequencies for:
IR-82, 83, 22, 726, 81, 723, 1726 (and anything east of Charlotte)
VR-88, 95, 97, 92, 48 (also stuff east of Charlotte)

Thanks again, leaving Sunday the 2nd and will post all logs when I
get back.

There are 3 flavors of 900 MHz phones I know of. The one spoke of is an analog, and these are easy to monitor. They are also the cheapest. Next is the digital on a single RF channel. These just sound like a buzz when the scanner locks on. The most expensive phones are the spread spectrum. The scanner won't stop if it's more than a few feet away from the phone. I think the spread spectrum phones are the most secure (aside from a corded), but I'm sure someday a hacker will find the coding scheme and make a few bucks selling it.

4548. Re: How Uniden came up with freqs on BC-350A

Newsgroup: rec.radio.scanner
Date: 1996-05-30 00:00:00 UTC
From: afn35036@afn.org
Message-ID: <31acb174.4995209@usenet.afn.org>
Source record: 232710

For those two or three of you who care, this is what Uniden customer service told me:

"The frequencies were chosen based on the frequencies most commonly used for those purposes:fire, police, etc. Every frequency in the bank is used for fire in a city somewhere , but what they are in other cities is not easy to predict. Anyone can use any given frequency if they are licensed and assigned to it. The bank freqencies are most commonly used for their designated purpose, but it isn't an absoulte. Unfortunately there is no list of those frequencies available."

In other words, the freqs they preprogammed into the service bands are used somewhere by somebody and may be used by other services in your area. For example, while listening to the "Fire/EMS" service band, I heard not only Fire and EMS traffic, but police and McDonalds drive-through.

: Mike Kenny, KB9KXB

Mike,

What exactly is the 'coin-drop' period you are referring to? A
customer can drop a coin ANYTIME during a phone call, and the mic certainly
isn't muted all the time. On *SOME* new phones, whenever ACTS comes on,
the mic *is* muted. The only fraud this would prevent would be the initial
charge. And it's possible to surpass that charge by placing your call through
the operator. As long as you kept simulating a coin-drop before ACTS came on,
mic would never be muted. The majority of new phones being installed in the
Bell-Atlantic region do not have the muting 'feature'.

It it turned on with the local key and adjusted with the tuning knob to one of 4 inversions. You know it's on because the display shows something, I can't remember off hand what it is, and the speech sounds like Donald Duck if it's on and the current frequency is not inverted.

>radio, just needs a bigger battery pack.

My experience is that I get only about 2 hours out of a fully charged
battery pack in my Pro 43. I have used Radio Shack nicads, heavy duty
nicads, and now even the Radio Shack "scanner battery pack" I have
also tried energizer and duracell alkaline batteries and still only
get 2 to 2-1/2 hours use.

I have sent my unit back to Radio Shack twice for service, they tell
me that the scanner will only get a longer battery life if I stay on
manual at a low volume level.

I am very unhappy with the battery life in my Pro 43. I can get 10 to
12 hours out of the batteries in my Pro 34..

Cross-posted to: rec.radio.swap,misc.forsale.non-computer,rec.radio.scanner

FOR SALE

1 MOTOROLA MTX-8000 MODEL B-5 TYPE I 800 MHZ TRUNKED H.T.

DETAILS:
-In EXCELLENT CONDITION (LIKE-NEW), as the unit was just purchased by myself on 2/96.
-Model Number=H01UCF6DB5AN
-All labels on front and back of the radio are in excellent condition and are intact.
-Alphanumeric Display
-Supports:
*15 systems
*10 subfleets
*10 conventional
*Talk-a-Round
*Talkgroup Scan
*Private Conversation List Capability
*Call Alert List Capability
*Telephone Interconnect List Capability (supports up to 19 #s')

Included in the package are the following: radio, stubby antenna, ultra-high capacity battery, rapid charger, owner/user manual, theory/troubleshooting manual, and original carton.

$1000.00 + C.O.D. shipping for the entire package listed above. Also open to VERY REASONABLE offers, but please keep in mind that these radios sell for about $1100 new here in Iowa. This radio is in EXCELLENT condition and is just like a new one.

Oh, I see, the liberal press has been fostering a major conspiracy to delude the American public into thinking the economy is doing wonderfully when in fact it really sucks, is that right? Gee, all along I thought that inflation, unemployment and interest rates were lower than they have been for a long time and the stock market was soaring to record heights.Gee, thanks for setting the record straight.

>
> Just my 2 cents...
> - Henry

The point is, that most of the freqs that people ask for--such as
cordless, airphones, Disneyland/World and aircraft--are readily available
in books and at numerous web sites. These are the sorts of freqs that
anyone is apt to get on their own if they are even mildly interested in
the hobby. Many don't because they are either lazy to learn how to use FTP
or Fetch or too cheap to buy Police Call, ScannerMaster, what have you.

I'm not talking about small town police freqs, Mir space station freqs,
federal bugs and all of those other more difficult to find freqs (although
a lot of those are available on line too).

ACARS help

I have the hardware and software for a program called
"Personal Code Explorer", from Microcraft. When used
with a computer, it will allow you to decode Morse,
RTTY, SITOR/AMTOR, HF packet and HF fax.
It seems to work pretty good for what it is intended for.
My question is. . . . .
Will it decode vhf ACARS on 131.55 ?? If so,
what mode should it be set for?

pse e-mail cheshire@ridgecrest.ca.us

Thanx for reading this.

Try theses aswell:

034.3500 241.4000
118.1000 250.4000
118.2000 250.5000
121.5000 250.8000
121.9000 251.4000
123.4000 251.6000
141.5600 275.3500
142.0000 360.4000
142.0250 384.4000
143.0000 391.9000
143.6000 394.4000
395.9000

These are out of a old scanner book. I've never had the opprtunity to
try them so it's unknown if they work.....

: annoying alert sound for which you could not adjust the volume..

: Has anyone seen a "nicer" weather radio that has more adjustments for
: the level of the alert sound, etc.? Anyone have an opinion on any
: particular model?

There may be laws that make the manuf'gr make the redio with a minimum sound pressure level and limit the adjustments that it has. This is because the lives of people are depending on the radio, so it has to give adequate warning.

Our security dept had a smog alert radio that had only a single channel and it had no volume adjustment. The girls had to tape a heavy piece of cardboard over the speaker to quieten it down a bit.

: I'd like to leave it on all the time (Hurricaine season in Florida!),
: but ain't no way I'd leave that radio shack model on...

: Please reply direct as well as post the group.

When I'm at airshows I often find that the air boss is using the clearence delivery frequency. It is interesting to listen in to the behind the scenes organization. The AF & Navy teams use their own freqs. Sometimes you can scan around and find it.

Drew Kendra CFI.

You can try the regular SS freqs., "Charlie", "Baker", etc., but they will most likely be encrypted. The best time to listen to the SS is when there is no VIP in town requiring protection. I recently heard SS agents following a guy around while he was passing bogus hundreds. They let him spend 5 or 6 before grabbing him, it was classic scanning!
Anyway, you are more likely going to hear interesting stuff from the PD of whatever town he is in. Try checking a channel that is not their regular dispatch freq.

Hey, I want one of these new Bearcat scanners (well kinda new).

The ones with the "PATROL ALERT" or whatever led's on them. They look nifty.

Curious if anyone has one and what they think.

Also want to buy one so If you got - tell me.

And if you know where to get used or new for good price - tell me.

Thanks.

4580. OPTO 456 Question

Newsgroup: rec.radio.scanner
Date: 1996-05-30 00:00:00 UTC
From: fk192@cleveland.Freenet.Edu
Message-ID: <4ol7e0$4hr@madeline.INS.CWRU.Edu>
Source record: 232742

I just added an OPTO 456 board to my 2006 and would like to know what is the best software to use with this unit. I know there has been postings over the last year or so about this subject but at the time I had little interest. Now that I have the board I would like to know what others are using.

4581. Business Band Freqs Needed

Newsgroup: rec.radio.scanner
Date: 1996-05-30 00:00:00 UTC
From: Radioman@localnet.com
Message-ID: <4ol2ud$lp3@prometheus.localnet.com>
Source record: 232743

I need the various available UHF & VHF frequencies that are used in the portable radios such as the Motorola Radius & similar type units. I think these are sometimes refered to as various "color "Dot" frequencies and there are 4 or 5 for each band available, Please post here or E-mail me if convenient. Thanks very much.
Regards, Raymond Miller N2NJK

>easily.

With the level of funding that NOAA is getting (not to mention the Congressional
rumbling to eliminate the whole darn Commerce Dept.), I wouldn't get excited
about THOSE prospects.

Another, slightly more feasbile idea:

(Assumes that the NWS has one site where all watches/warnings are located)

A program that scans local watches/warnings for your preprogrammed keywords
(say, in my case, SUFFOLK COUNTY and WARNING), and then carries out whatever
action you specify -- sound an alarm, print the bulletin, perhaps dial up your pager,
etc.. With cable modems and ISDN somewhere (!) on the horizon, I can see the
day approaching where most PC's are left on (and connected) 24/7, making this
feasible.

4602. Orlando FL FD Freqs??

Newsgroup: rec.radio.scanner
Date: 1996-05-30 00:00:00 UTC
From: dave_g@ix.netcom.com
Message-ID: <4oiuhp$c4d@dfw-ixnews2.ix.netcom.com>
Source record: 232843

A few months ago, both Orange county FD and Orlando city FD moved to new trunked systems.. I am not sure if they are sharing a common system or each have their own. For a time, AFTER the switchover, I reliably heard Orlando FD on the FORMER Orange county 800 MHz repeater freqs (857.4375 and 860. 4375) as if they were being constantly crosspatched. Now this seems to have ended. Also, for years, Orange county "simulcasted" dispatch on 153.95, but that also seems to have long-since ended.

Does anyone know of a small group of dedicated frequencies for the City/County FDs, or are they now just a part of the overall trunking system?

tnx

dave

>why would anyone want a base only model? Any comments?

>Thanx in advanz for your wisdom.

>D. Haas

Base-only models tend to be AC powered and more substantial (partially
due to internal power supply components) in size and weight.

Mobile-only scanners tend to be smaller & lighter, run on DC only, but
may have additional noise inhibiting circuitry to deal with a vehicles
noise environment.

Most people wouldn't want to put a huge scanner in a car, or a dinky
less-impressive mobile on their table (I personally don't care, but
you know those psychologists and marketing "experts").

Otherwise, they frequently are virtually the same in capabilities for
the most part. However, the base models have more room for "bells and
whistles" like big meters or displays, larger internal speakers, etc.

Take your pick...

>to get 8 hours from a single charge but so far that
>has not been the case. I am using Radio Shack
>batteries (mistake?) and charging them for about 12 hours....

You really should charge them for 16 hours.

From my PRO-43 product review:

"..Current drain from batteries was measured at 88 ma. while
scanning and 90 - 140 at various settings of the volume con-
trol with the squelch open. The PRO-43 averages 36% higher
current drain than the 200XLT which means the batteries will
need recharging more frequently...."

If your battery life is short, measure the current
drain and compare it to the figures above.

I have a Universal M-400 Decoder (Version 2.0 - latest version)
complete with manual, power supply, computer interface, cables, and
Ci - 400 software. The unit is in excellent condition and will decode
the following:

Baudot
ASCII
SITOR A&B
FEC-A
SWED-ARQ
FAX
ACARS
POSAG Pager Data
Golay Pager Data
CTCSS PL
DCS PL
DTMF Tones

The CI-400 interface allows the unit to monitor user definable cap
codes which can be set to flag an alarm as well as store the dat on a
pc and/or print to printer. The unit is handy for monitoring your own
pages, news, weather,sports,emergencies, or anything else you may
want.

I am asking $350 for both or
$325.00 for the M-400 and
$50.00 for the interface and software.

The Unidens you mention are not full coverage receivers. The AOR8000,
AOR3000A, ICOM R1, and ICOM R100 are (and so are a number of others). They
are quite a bit more $$$ though!

GO>Why in the heck do they take the RF board out of such a great and
GO>expensive scanner for???

The spooks combine many RF boards to make some sort of multichannel wideband scanner. I saw the "boxes" being sold at a local flea market and go the story. Just the box, wall wart, cpu board, and manual cost around $80.

I believe the original AR3000 stock was bought up by the DOD during the Gulf War for the same reason. It must be cheaper to buy these scanners and hook them together than to create a military program to develop a 400 simultaneous channel scanner. You couldn't just put a bunch of AR3000As in the same room and expect them to work since they are poorly shielded. Thus, I suspect they just take the RF boards and put each in a metal box and then connect all these boxes together.

: which run slower for several hours record time, look in the magazines for
: ads.

Actualy, the best thing i can think to use is an old Reel to Reel type
recorder... I"ve got a small one over here and i can record 3 hours
strait (unattended) and if i'm there to change things, i can put 12hrs on
a tape... (I'm using the 8Inch reels).. If you were able to find one with
10Inch reels or better (dont know if they got bigger than 10) you'd have
at least 5hours unattended space.... (20 attended)

The only thing you might have to rig up is a way for it to start and stop
without turning off the power. (sure that's DoAble)

4619. Increasing handheld Audio Output

Newsgroup: rec.radio.scanner
Date: 1996-05-31 00:00:00 UTC
From: Scott Ryan <crtoy@fyiowa.infi.net>
Message-ID: <4ommqq$q3r@nw101.infi.net>
Source record: 232689

I need help on increasing the audio (headphone jack) output on handheld scanners.

Currently we're using a BC SC150 in a sportsman stock car so the driver can listen to restart line-ups, trouble on the track, etc. We need some way to boost the audio output sa as the driver can hear clearly under full racing conditions (he is now only able to hear transmissions under caution flags).

Any ideas on better earplugs for loud conditions would be of help also.

Thanks in advance

4621. my new AOR8000, tks for the advice

Newsgroup: rec.radio.scanner
Date: 1996-05-31 00:00:00 UTC
From: d-cripps@dircon.co.uk
Message-ID: <4omrqi$q49@newsgate.dircon.co.uk>
Source record: 232691
Cross-posted to: alt.radio.scanner.uk,alt.radio.scanner,rec.radio.scanner

First if all thanks for all the replies to my enquiries
about the AOR8000 verses the MVT7100.

I've finally chosen the AOR 8000, been using it for a few days
and find it a great little radio.

The BIG selling point for me was the Alpha tagging on memory
channels and search bands.

I've used an AOR3000 for about six years (I believe one of
the first into the UK that wasn't sold in Cheltenham)
and love the performance, but use an external PC program to
provide control and names for the individual channels.
The 8000 has this facility built in.

With 1000 memeory channels to remember, having the alpha tag
is a real big point, trying to remeber if mem A26 was the North
or South London 2M amateur repeater was difficult (what else
are you ALLOWED to use a scanner for in the UK?)

The performance MAY not be upto the 7100, but as most scanning
is probably listening to relatively strong NFM TX, weeding out
the microvolt signals using a hand held is a little optimistic.

The support that AOR gives is also great; a quick question about
the bandplan (mine has a funny with WFM switching to NFM at about
102MHZ) was followed up by a printout of the current UK programmed
plan and an offer to update my bandplan if required for the cost
of postage!

I haven't got the PC interface, YET, but did buy a replacement
antenna and made up a 1.6M telescopic on a BNC for the SW (which
now makes the 8000 comparable to my Sony SW100 when listening to
Shannon Volmet on SSB!).

So thanks again for all the advice.

David Cripps

This is the wrong forum for this discussion and I'll get flamed for my troubles but I gotta say one thing. If you think everything is so hunky dory, keep a close eye on the effects of the drought situation and the wheat crop failures. In a rosy economy like you've suggested, we wouldn't even blink at some higher food prices. However, regardless of the indicators, things are going to be difficult for a LOT of people because of coming price hikes and all the hype about our great economy will be seen for exactly what it is; BS!

Now for something within topic boundaries.... Has anyone taken a look at the list of freqs in MT for the Olympics? That oughta keep some folks busy for a WHILE punching freqs into their radios! <chuckle>

Have a good day... Hutch

Your sort of correct, some systems don't (And weren't designed to) cover
the areas you want so it's easy to just slap in a 3K. Also, you have a
lot of channels in the 3K that you can load in to just monitor and plug
the more important freqs into your Mil systems. Go look at a EA-6B
Prowler, a good number have had 3K's installed in the Back Right ECMO
slot. On ships it all depends on how much the command wants to spend. If
they are liberal and have the cash they may go for a3K, if not, start
looking at a 2005/6. One ship I was on had a 3K, the other a 2005.
Both were awesome. When the ship that had the 3K decommed I tried to see
if the scanner could be sold for "surplus" but no dice. I always wonder
what happend to it:-(Whats worse is now I'm stuck with a BC200:-(Nice
scanner, but when you've got used to 2005 and a 3K, well, it's kind of a
step backwards.

If you have a Mac, then you need WAVE. If you have a PC, then you have several options. Radio Manager, ScanStar, ScanCat, and others all have demo versions and will work fine for most applications. My personal favorite of the PC versions is ScanStar. I use the Dos version from a Dos window in Windows 95, but have not yet tried the Windows version.

Well John. . . . .
I've been using Optoscan for over a year. I don't like it! But I
haven't seen any thing better. If you find something please let me
know.

Thanx

ISP on I-88 use 855.7375 and 855.4875, maintenance units use 856.7375 and
856.4875. ISP Car to Car on the tollways can be found on 155.925,
154.650, 154.665, 156.000 or 154.950

Charles Town Mall:
464.475 Bergners
464.675 Mall management

Target:
461.6625
461.8625
467.7625
469.0625
All above are probably electronic inventory units.

Look at 151.625, 154.570, and 154.600 for voice ops. Many Target
employees have HT's on these freqs.

Sorry, I don't have anything on the Merc.

I don't want to start an off topic political debate, but do you really
think the press is playing the reporting of news "straight" ?

As a scanner user you should be well aware of the deviance from the
actual events and the reporting and "spinning" of these events!

4634. Signal Tracking (1)

Newsgroup: rec.radio.scanner
Date: 1996-05-31 00:00:00 UTC
From: n0nas@hamlink.mn.org
Message-ID: <833530287.AA06492@hamlink.mn.org>
Source record: 232754

to: kamst39+@pitt.edu
KA>I was wondering how easy it would be to track a stationary transmitt
KA>Let's assume we have a transmitter, transmitting frequently but not
KA>constantly at 5 watts. The transmitter is operating at say, 145 mhz.
KA>The antenna used on the transmitter is a 16inch whip.

Very easy. This is in the ham 2 Meter band and is very commonly used for hidden transmitter "fox hunting." The antenna used has little effect on the mechanics of the "hunt" except for how easy it is to hear the signal. Many areas around the country have active groups holding "hunts" on a regular schedule. Hunts may be strictly local (5 to 20 miles) or one of the famous California All Day hunts that may cover 200 miles or more. (The rules for a California hunt are along the lines of: There will be a transmitter and it will not leave the continent.)

KA>What methods could we use to track that signal? I'm interested in methods
KA>that could actually be used without $20,000 pieces of equipment and so on.

Equipment varies depending on how close you are to the transmitter. If real close, proper equipment might be a cardboard box covered with tin foil or just hold the radio close to your chest so the radio and antenna is "shielded" by your body. This is called "body fade" and the direction of strongest signal is right in front of you.

Specialized equipment could be a directional antenna (a beam or quad antenna), or a hand held direction finder, or a vehicle mounted doppler system. I built my first hand held unit with about $5 worth of parts. They can be purchased starting around $80. A top-of-the-line doppler system from Doppler Systems sells for about $350-$400 or you can buy a board or build a kit for $25 to $90 (plus scrounging parts for the antennas and a box). Fox hunters often use their scanner as the receiver in the DF system so they can keep the ham radio for transmitting to coordinate with other hunters.

KA>Would a highly directional antenna rotated at say 5 degrees measuring the
KA>'power' of the signal at each rotation work? I suppose we could use the
KA>logic that the most powerful reading would mean we were pointed
KA>directly at the signal and the weakest signal would mean we were
KA>pointed directly away from the signal.

That is basically what you would do if you use a beam or other directional antenna. You rotate the antenna and watch the signal strength meter for the highest reading or listen for the best "quieting" and least hiss on the signal to get a bearing. Most hunters use variable attenuators in the antenna line so they can reduce the signal strength for a noisier signal.

Beam antennas are usually the most sensitive and best for weak signal or long range hunts. Doppler systems are visually quick and easy to use. With practice you can almost drive right to the transmitter. No matter what type of DF system you use, you must be aware of and know how to recognize signal distortions and poor locations that will give you bad bearings to the transmitter. On my first hunt, I got very lucky and my bearings crossed within a couple blocks of the fox from over 5 miles away. I had trouble because I didn't believe my results. On my second hunt I didn't take enough bearings and when my second bearing was wrong, I spent the next hour searching the wrong location and unable to get another good bearing.

KA>And if you suggest methods like triangilation(sp), then explain the logics
KA>and actual methods that consists of.

To triangulate a transmitter, find a good location, preferrably high and clear where you can take a bearing. Use a compass and be as accurate as possible. Find your location on the map and draw a line along the bearing extending from the location. Then drive some distance at right angles to your bearing and take another bearing. Mark it on the map too. Do this at least three times and where the marks cross is where you want to look. The closer the bearings come to a point, the higher your confidence. Now drive closer and start over taking more bearings. The marks will seldom cross well enough to show a point. You always have some error in a bearing, maybe a couple degrees, maybe 10 or 15 degrees. The idea is to keep getting closer by taking more bearings from closer and closer distances.

Note, you must know your "magnetic declination" to get an accurate line on the map. Magnetic declination is the difference between where the North Pole is and where the MAGNETIC north pole is. The magnetic north pole is somewhere under Hudson's Bay and just looking on a globe will show you the difference between the North Pole and Magnetic North from your location. You should be able to get the real number from a local surveyor or city public works or US Geological Survey office. For St Paul, magnetic declination is about 7 degrees east. That means that if I read 120 degrees on the compass, I mark 127 degrees on the map.

Most hunters work at least two people to a car. The driver DRIVES, he doesn't watch equipment. The second person takes the bearings and plots the map. Often you have one person take readings and a third doing plots and telling the driver where to go. If you have equipment mounted so you can take bearings on the move, it may save you time and can also

help average out some of the multipath distortion I mentioned earlier.

The absolute best information you can get on fox hunting is in the book "Transmitter Hunting: Radio Direction Finding Simplified" published by Tab books and sold for $19 plus shipping thru the ARRL book service or maybe at a local book store. The ARRL has a web page at www.arrl.org or else you can probably find QST magazine at the library or book store and read the ad in the back. You can also find good info in the monthly "Homing In" column in 73 magazine. There are ads in both magazines for various types of direction finding equipment. Buy the book, read everything you can find, and enjoy. DFing can be a lot of fun but can also be frustrating. It takes a lot of practice to be the best. 73's.

>>Does anybody have a bunch of military air/ground/sea freq's? I'm looking for ones that are in the Bay Area, CA.
Please email me and/or repost. Thanks!<<

Since I've recently gotten into Mil Freq scanning I'd be interested also since I'm in Oakland. BTW: I got a hold of "The Comprehensive Guide To Military Montitoring" by Steve Douglass, it's a good starting point. I entered a batch of frequencies from the book and was able to pick up some action on 251.1 (Navy/AF Refueling), 364.2 (Air Combat Command), 321.0 and 236.8 so far. There seems to be a lot of directing of mil aircraft on Oak Center's 387.1 frequency. Also you might want to try searching138 to 152 AM since a lot of military aircraft now have that capability. If anyone else has any good tips or Mil Freqs for the SF Bay Area, pass them along. Thanks.

- Henry

Hi all,

I'm leaving for Branson on Sunday morning (2 June)...anyone got scanner frequencies for the area? I understand there are sight seeing copter flights over the area, I'd like those freqs along with the usual local PD, FD, etc etc.

Thanks for any help, and if I can help anyone with freqs in Central Indiana I'd be more than happy to!!!

BTW this is my first post, I just signed up with the internet provider here in Muncie.

Thanks again,
Rick

I will be taking a trip from Minot, ND to Denver, CO next weekend and would be interested in some interesting freqs to put into my scanner. I will either be going down US 85 to I 25 or US 83 to I 70. If anyone can provide the freqs for state police, maybe some ham repeaters along the way, and any other interesting things, please do. You can either email me (see below) or just pos them here and I will get them. I need this on of before the 7th of June as we are going to be leaving that evening.

Thanks in advance for info anyone provides!!!

Good post, and good points. However, they aren't ALWAYS valid (although they are a lot of the time) Case in point. Last night (Thursday) I was invited for a trip to Branson on Sunday. We live in a small town, and even if I did order a MO scanner book, it wouldn't get here before I left. No one in town carries anything. Also, books are fine, but the information goes out of date quickly, and more quickly than ever before. There's nothing better than having up to the minute info from a local!!

Just my thoughts :)
Rick N9GSU

Radioman@localnet.com (Raymond Miller) asked:
> I need the various available UHF & VHF frequencies that are used in the
> portable radios such as the Motorola Radius & similar type units. I think
> these are sometimes refered to as various "color "Dot" frequencies ...

From the FAF - Frequently Asked Frequencies
on CompuServe - Hamnet as FAF.TXT

Dot Frequencies

Dot color Other
Red 151.625 itinerant "J" Dot 467.7625
Purple 151.955 "K" Dot 467.8125
Blue 154.570 Silver Star 467.850
Green 154.600 Gold Star 467.875
White 462.575 GMRS Red Star 467.900
Black 462.625 GMRS Blue Star 467.925
Orange 462.675 GMRS
Brown 464.500 itinerant
Yellow 464.550 itinerant

"Dot" stickers are used by the manufacturer or distributer to
indicate the frequency of otherwise identical transceivers. They
are often found in rental inventories and on construction sites.
Additional itinerant frequencies include 27.49, 35.04, 43.04,
151.505, 158.400, 469.500 and 469.550 MHz.

4644. Re: Trunked Question

Newsgroup: rec.radio.scanner
Date: 1996-05-31 00:00:00 UTC
From: GPMA86A@prodigy.com
Message-ID: <4onjcr$17bs@usenetp1.news.prodigy.com>
Source record: 232764

Trunked operation selects a new working channel for every transmission (Ericsson EDACS - "Transmission Trunking")or for every conversation (Motorola Smartnet I,II, Astro "Message Trunking"), the efficiency is greatly increased because a new working channel is allocated to the next user, rather than being dedicated to a single group.

For example, a repeater for Police or Fire may be used (and crowded) all the time, the Public Works Dept. repeater is rarely used and therfore a wasted resource. A trunked system pools all the resources (repeaters) together so that they can be shared. A computer makes the working channel assignments on an as needed basis, giving the next available channel to the user.

Radio capacity on a trunked system grows exponentially vs a conventional system with loading limits on a per repeater basis.

New technologies such as Ericsson's TDMA and Motorola's FDMA will cause a reat deal of panic in the scanner community, because these signals are all digital and will sound similar to the controls channel we hear now on these systems. More later FM

If we could get some up to date info on those books or cd's it would eliminate this newsgroup all together. But when you look at the lead time of printing,shipping,stocking,etc. time passes slowly.
Look at the last police call. They still show MN hwy patrol frequencies that have not been used for seven years. And if you want to listen to the hwy patrol aircraft don't look for it in ther book or or cd, the listing is just plain WRONG. That's why
we need places like this . to get the latest on everything.

For Sale: AR8000 Scanner and accessories.

I will only sell as a COMPLETE SET, I will not break them up! I have used the below Items VERY little, they are in ABSOLUTE MINT condition and all work perfectly. I have done the hot glue fix on the AR8000INF ribbon cable. I will also include a disk copy of the knowlege base I have accumulated over the last 1.5 years from Usenet groups and other places. It is about 115 KB in Word 6.0 format. I can TRY to convert it to other formats before shipping if necessary. If you meet or beat my price I will throw in a special bonus that I'd say is worth at least $50-$100 depending on if you are a collector.

Interested parties may contact me via email tom.howley@moa.net. If you live within resonable distance to Waterford Michigan, you can see it before you buy.

Paid New Item
$599.00 AR8000 Scanner- US Version
800 MHz unblocked
US Bandplan 'Tweaked'
Original Packaging
12V DC Car Cord

: Does this require a licence (eg is it basically a low power industrial
: frequency) or is it licence exempt?

1. The service is the FRS... Family Radio Service, NOT the FSR
(correcting the origional poster)

2. The service is NOT for industrial use. It is for personal and
Family communications.
3. The service does not require a license.
4. This service is for use in the U.S. only.

Hmmm....I'd be interested to hear about an incident you've heard on a
scanner where the press reports mutilated the actual facts.

>Thanks in advance

Sure. . . . TWO things. . . . 1. Radio Shack used to sell a small
xistorized amplifier the size of a small radio. If this won't give
you the boost you need, then I reccommend using earphones. The kind
that encloses the entire ear.

: Based on what I read in the papers today, the Blue Angels look like
: they might be out of commission for the rest of the season. Their
: lead fly guy just called it quits. Something about personal training
: problems...

Three weeks, doubt the whole season. I have the frequencies here somewhere, just saw them last month. Could tell by the radio traffic that things were not running smoothly. "C'mon guys, concentrate." "Fly the airplane guys, don't let it fly you." That kinda thing.

I have the same combination as you described. I have Scan Star Plus for Windows and also Probe Ver 2.0. I would
highly recomend Probe. It a dos program however but this does not present a problem at all for me. I have a
100mhz Pentium and can achieve around 100 channels per second scan rate without missing any signals. This is
far better than any other software I have used on the OS 456.

Richard

[ProbeThe Next Generation of Computer-Controlled Scanning]

[ ] Probe is an excellent piece of software I use with my Pro-2006 and
OptoScan 456. Others can't compare. I liked it so much I created a Web
page for it. Check out my comments. -Steve Hancock

[Image] Users comments

* I've been playing around with PROBE for a about a week now and I'm getting used to having it around... This one will be a keeper! - E. Lentz, Pasadena, TX

* I would like to take this opportunity to talk about something that works! I have recently coupled the PROBE software with the full-blown regional database CD from PerCon and the results are impressive. It gives you the ability to immediately get on top of a situation and not have to mess around with first finding and then entering frequencies. The combination of this hardware and software has completely changed the scanning experience! - Phil A., Glenbrook, NV

* Out of all the radio controlled software I own, PROBE is the one I use. I've had computer scanning programs for a long time, running on the Icom R7000, 7100, etc. But I've never got excited enough about any of them to use them for long periods of time. PROBE coupled with the OptoScan interface is the easiest to use by far. It's on while I type this message, in fact. I'd strongly recommend PROBE. - Ken R., Manchester, MO

* PROBE is the software I use the most and am quite impressed with many things, but two items that are real important to me is the interaction and amount of information you have at your finger tips. This makes the system much more flexible and lets you "fine tune" the system for personal likes. For many years there have been small things that bug me about the way scanners work and I can "fine tune" all of these out with the PROBE system. The power of this software really improves the enjoyment of scanning for me. - Mike D., Dubuque, IO

* After "demoing" the other versions of scanner software i.e. ScannerWear, ScanStar, etc., PROBE is definitely the best software I've used. I'm very happy I chose PROBE. It does everything I wanted in a computer controlled scanning software and then some. - Paul H., Winnipeg, CN

* Love your software. - R. Thompson, Aiea, HI

* Blows away ScanCat Gold in my opinion. - R. Nelson, LaCrosse, WI

* I have been using PROBE about one week... Great program, lots of fun! - C. Braseth, Grand Forks, ND

* I like the program - easy to use and nicest looking screen. Runs fast. - D. Edwards, West Islip, NY

* This is an excellent program. - R. Jones, Las Cruces, NM

* Like PROBE better than any other. - J. Givens, Ixonia, WI

* Have tried other software but only using PROBE now. - J. Rung, Heidelburg,CN

* One word "Great". - R. Berzinski, Lowell, IN

* I have only been running your program for 10 minutes, and I LOVE IT!!! I am converted from Scanner-Wear... R. Barnett, Huntsville, AL

Hi, I'm thinking of buying a Pro-62 from Radio Shack. Has anyone tried it, and can give a simple report? Also, are there any mods? I checked one large page with downloadable mods for all the Pro-line scanners, but none were listed for the 62, because it was fairly recent.

Email me if you would!
Thanks!

4663. Re: Endeavour launches today, how can we listen?

Newsgroup: rec.radio.scanner
Date: 1996-05-31 00:00:00 UTC
From: SEColegrove@msn.com
Message-ID: <00001ff6+00004e34@msn.com>
Source record: 232783

The best source for the frequencies is the NASA homepage. They give frequencies, flight schedules, how to get launch passes, etc. Any browser will get you there. I'm in Southern California, and I tune to 448.500 (a local ham repeater). This frequency was listed at the NASA shuttle page. I just entered all the local frequencies, scanned during the flight, and locked it in when I heard the transmission. You hear all of the conversations, from Huntsville, Houston, and the shuttle - inside and EVA.

4664. Re: Lancaster/Palmdale CA. Freqs.

Newsgroup: rec.radio.scanner
Date: 1996-05-31 00:00:00 UTC
From: bjohnson@thekat.esnet.com
Message-ID: <797_9606022356@thekat.esnet.com>
Source record: 232784

The following should help for Palmdale area:

Los Angeles County Sheriff - 483.7625 (R)
L.A. County Fire Dept. (Battalion B) - 470.5625 (R)
Fire Department Tactical - 154.430
Local Government Ops 1 - 471.0375 (R)
Local Government Ops 2 - 470.3375 (R)
(Note: Local Government operations include Parks & Recreation, Engineering, Streets, Solid Waste & Sanitation Services)

Mosquito Control Division - 453.850 (R)
Palmdale School District

School Bus Operations - 855.2125 (R)/855.7125 (R)
Security Patrol - 151.895

For the Lancaster area check out the following:

Los Angeles County Sheriff - 482.8625 (R)
L.A. County Fire (Battalion 11) - 470.4875 (R)
L.A. County Fire (Dispatch) - 470.5375 (R)
L.A. County Fire Tactical - 154.430 (Fireground)
Local Government Ops - 453.650 (R)
Local Govrernment Ops - 155.715
Parks & Recreation - 154.100 (R)
Antelope Valley College PD - 461.175 (R)

The above should help you find the right frequency for what you wish to hear. The above information can also be found in Southern California Scan Fan (6th Edition). Good luck. Happy Monitoring...Brian.

>I beg to differ. The term "shortwave" in itself has no meaning other
>than a band of frequencies ABOVE the broadcast frequencies. This
>would seem to include the so-called "scanner" frequencies.

The term "shortwave" usually refers to frequencies below 30 MHz, but I
don't think there is actually any formal definition.
This is really a matter of history. Back in the old days frequencies
above 30 MHz wasn't even considered usable for radio communication, so
the terms longwave, middlewave and shortwave was used to name the frequency
bands used.
When technology developed the frequencies above 30 MHz became usable and
although this meant even shorter waves, the term shortwave was not used
very much regarding the new frequencies. Instead terms like VHF, UHF is used
just like frequencies below 30 MHz is referred to as HF.
Today when a radio amateur is talking about shortwave he surely means frequencies
below 30 MHz
